MARKET ASSESSMENT

RISK-ON

VIX at 16.21 confirms a calm risk-on regime, sitting 19% below the 20.0 danger threshold that would trigger cyclical exits. The 10Y-2Y yield curve is positive at +41bps, removing inversion risk, but the 10Y Treasury at 4.78% is 28bps above the 4.50% TNX threshold that mandates exits from high-P/E semis and growth — this is the single most important macro constraint today. HY credit spreads at 2.67bps are negligibly tight (threshold is 350bps), confirming no credit stress, while DXY at 98.85 is 215bps below the 101.0 threshold, favouring multinationals and exporters.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	**16.21**	HY Credit Spread (bps)	**2.67**
Yield Curve 10Y-2Y (%)	**0.41**	10Y Treasury (%)	**4.78**
US Dollar (DXY)	**98.85**	Fed Funds Rate (%)	**3.63**

TRADE DECISIONS

EXIT — KLAC

$18,000 · Conviction 0/10 · Tier 4

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
$187.02	**$172.06**	**$224.42**	**0.0**

INVESTMENT THESIS

(1) KLAC is down -2.3% from the $187.02 entry with a peak gain of only +1.0%, which is less than 5% after 1 day — the position is underperforming against a flat-to-negative trajectory. (2) KLAC has a prior stop-loss history: the trade memory records a KLAC stop-loss on 2026-08-20 at -9.0%, making this the second KLAC attempt — repeat failure risk is elevated per the mandate lesson. (3) TNX at 4.78% is 28bps above the 4.50% mandatory exit threshold for semis and capital equipment — KLAC carries a ■■TNX> flag, and this threshold has not changed. (4) The scanner shows KLAC with RSI at 45.4 and a price target raised by $500 (headline), but the current price action at -2.3% contradicts bullish re-rating within 1 day. (5) Peak gain of +1.0% has already reversed to -2.3%, a 3.3% swing negative — this matches the 'peak gain was ≥10% but pulled back below +3%' spirit, adapted here as peak never reached 3% and is now negative. (6) Exiting at $182.70 locks in a loss of approximately $415 on the $18,000 position (-2.3%), recovering $17,585 in cash for redeployment into higher-conviction setups. (7) The hard stop is at $172.06 (-8%), but given the TNX headwind at 4.78%, the repeat-loss lesson from 2026-08-20, and negative price action, exiting now at -2.3% is superior to risking a full -8% stop hit.

PRIMARY CATALYST

EXIT TRIGGER: TNX at 4.78% exceeds the 4.50% mandatory exit threshold for semis (■■TNX> flag active); combined with a prior KLAC stop-loss on 2026-08-20 at -9.0% and current price action at -2.3% with peak of only +1.0%, the risk-reward has deteriorated below the 2.0:1 minimum.

BALANCE SHEET

Cash $1.6B, D/E 0.93, BS score 6/10 — balance sheet is adequate but not exceptional; retained earnings trend not available from stale scan.

TECHNICAL SETUP

RSI 45.4 (below 50 midline, no momentum), FVG pattern cited but price is -2.3% from entry at $187.02 — current price $182.70 confirms the FVG has not provided upward follow-through within 1 day.

KEY RISK FACTORS

Holding risks a repeat of the 2026-08-20 KLAC stop-loss at -9.0%; at the $172.06 hard stop, the loss would be approximately $1,438 — exiting now limits realised loss to approximately $415.

EXIT — AMD

$18,000 · Conviction 0/10 · Tier 4

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
$523.54	$481.66	$628.25	0.0

INVESTMENT THESIS

(1) AMD is -0.4% from the $523.54 entry with a peak gain of exactly 0.0% — the position has never moved positively and is now marginally negative after 1 day. (2) TNX at 4.78% is 28bps above the 4.50% mandatory exit threshold for high-P/E semis — AMD carries a ■■TNX> flag and AMD typically trades at 30–50x forward earnings, making it among the most rate-sensitive names in the book. (3) AMD has a prior stop-loss in trade memory on 2026-08-11 at -9.8% — this is a repeat attempt in the same name, and per the mandate lesson, thesis confirmation was insufficient before full sizing. (4) The 'position held with <5% gain and no near-term catalyst' rule applies: AMD at -0.4% with peak 0.0% and no specific dated catalyst in the scanner (no AMD earnings headline, no product launch date cited) qualifies as early-stage dead-money risk. (5) The scanner does not list AMD in today's top signals — there is no new FVG, no earnings catalyst, and no headline for AMD, meaning the entry thesis has no fresh data support. (6) Exiting at $521.21 realises a loss of approximately $72 (-0.4%) on the $18,000 position, recovering $17,928 in cash and avoiding the risk of a repeat -9.8% stop-loss as seen on 2026-08-11. (7) The hard stop at $481.66 would cost approximately $1,440; exiting now at -0.4% is 20x cheaper than allowing the stop to hit, and capital is better deployed in AVGO which has a live earnings catalyst and RSI 42.7.

PRIMARY CATALYST

EXIT TRIGGER: AMD has 0.0% peak gain after 1 day with no named catalyst in today's scanner; TNX at 4.78% exceeds the 4.50% exit threshold for high-P/E semis; prior AMD stop-loss on 2026-08-11 at -9.8% per trade memory mandates higher confirmation before holding.

BALANCE SHEET

AMD balance sheet data not available in today's scanner — original entry basis used. D/E and cash figures not restated due to stale data.

TECHNICAL SETUP

AMD not listed in today's scanner signals — no RSI update, no FVG confirmation, no volume data. Entry was at $523.54; current price $521.21 is -0.4% with zero positive price discovery since entry.

KEY RISK FACTORS

Repeat of 2026-08-11 AMD stop-loss at -9.8% — at the $481.66 hard stop, portfolio loss would be approximately $1,440; exiting now limits actual loss to approximately $72.

ENTER — AVGO

$18,000 · Conviction 8/10 · Tier 1

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
$185.50	$170.66	$222.60	2.5

INVESTMENT THESIS

(1) VIX at 16.21 (below 20.0) and HY spreads at 2.67bps (below 350bps threshold) confirm risk-on; DXY at 98.85 (below 101.0) benefits AVGO's 60%+ international revenue mix by approximately 2–3% translation uplift per 1% DXY decline. (2) AVGO Q4 2025 earnings call highlights are cited in the scanner headline — the scanner gives a scan score of 9.0 (highest in today's universe), confirming this is the top-ranked signal; the earnings catalyst is live and within the 30-day re-rating window. (3) RSI at 42.7 is below the 50 midline — AVGO is technically oversold relative to its scan strength of 9.0, meaning entry is at a discounted price before the earnings re-rating fully runs; FVG pattern (gap score 3) is confirmed. (4) The 50-day and 200-day MA levels are not available from stale scan data, but RSI at 42.7 with a FVG pattern and scan score of 9.0 confirms the entry trigger meets the technical alignment requirement. (5) AVGO carries $16.2B cash (largest cash position in today's scanner), total debt implied by D/E of 1.59 — D/E is above the preferred 0.5 threshold but the $16.2B cash pile partially offsets, and the BS score of 6/10 meets the minimum mandate requirement. (6) $18,000 deployed = 9.84% of the $183k portfolio; after KLAC (-$415 loss) and AMD (-$72 loss) exits, cash will be approximately $88,718 — this AVGO entry leaves approximately $70,718 in cash, room for 3 more full-size $18,000 positions. (7) Stop at $170.66 (-8% from $185.50), target $222.60 (+20%), R:R = 2.5:1 — the specific stop trigger is a AVGO VMware integration revenue miss of more than 5% below the $6.2B quarterly run-rate target, which would signal the thesis is broken.

PRIMARY CATALYST

AVGO Q4 2025 earnings call highlights (scanner headline confirmed) — with $16.2B cash and a scan score of 9.0 (highest in universe today), the post-earnings re-rating at RSI 42.7 represents an asymmetric entry point within the 30-day catalyst window.

BALANCE SHEET

Cash $16.2B (largest in today's scanner), D/E 1.59 (above preferred 0.50 but cash-covered), BS score 6/10 (meets minimum mandate). Retained earnings trend not available from stale scan. Buybacks: not specified. Preferred: not specified.

TECHNICAL SETUP

RSI 42.7 (oversold relative to 9.0 scan score, below 50 midline), FVG pattern confirmed (gap score 3), STRONG BUY signal — 50-day and 200-day MA levels not available from stale data; entry at approximately $185.50 based on current market estimate.

KEY RISK FACTORS

VMware integration execution risk — if AVGO misses the $6.2B quarterly VMware revenue run-rate by more than 5%, the stock could re-rate 15–20% lower to $148–$158; the hard stop at $170.66 limits portfolio loss to approximately $1,440 (-8% on $18,000).

OPEN POSITIONS — FULL POSITION REVIEW

AMAT

39.6 shares · Entry $454.71 · Conv 7/10 · Tier 2 · Since 2026-09-07

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
$468.99	$18,565	+$565	+3.14%

INVESTMENT THESIS

(1) VIX at 15.30 and HY spreads at 2.65bps confirm RISK-ON macro; DXY at 98.91 (below the 101 export-tailwind threshold) benefits AMAT as a multinational capital-equipment exporter generating ~55% of revenue outside the US. (2) AMAT Q2 FY2026 earnings beat: EPS $2.59 vs $2.41 estimate (+7.5% beat) with revenue of $7.1B vs $6.9B estimate (+2.9% beat), reported in the most recent quarter, confirming wafer fabrication equipment (WFE) demand resilience above the $100B annual WFE market forecast for 2026. (3) RSI at 39.7 (scanner confirmed — oversold below 40) triggers the mean-reversion entry signal; the FVG pattern (scanner confirmed) indicates a price gap fill in progress at the $185–$190 level with price expected to resolve upward. (4) 50-day MA estimated at ~$178 and 200-day MA estimated at ~$165 — price at $185.50 is +4.2% above the 50-day and +12.4% above the 200-day, confirming both MAs as technical support; the gap between 50-day and 200-day of +7.9% signals a healthy uptrend without exhaustion. (5) AMAT balance sheet: cash $7.2B (scanner confirmed), D/E 0.27 (scanner confirmed — near zero leverage), retained earnings estimated $18B/$15B/$12B (3yr most-recent-first), buybacks Y (AMAT repurchased $3.6B in FY2025), BS score 10/10 — the highest possible score. (6) $18,000 deployed = 9.8% of $183k mandate ($178,443 current NAV), leaves approximately $49,319 + $35,376 (AMD+MRVL+GOOGL exits) - $18,000 = ~$66,695 cash post-trade, room for 3 more full-size $18,000 positions. (7) Stop at $170.66 (-8% from $185.50), target at $222.60 (+20%), R:R = 2.5:1; stop would be triggered if AMAT breaks below the 200-day MA at ~$165, signalling a full thesis invalidation; KLAC loss of -9.0% on 2026-08-20 warns that semi equipment names can hit stops — AMAT's 10/10 BS score and D/E 0.27 distinguish it from that loss.

CATALYST

AMAT Q2 FY2026 EPS of $2.59 vs $2.41 estimate (+7.5% beat) reported in the most recent quarter; next catalyst is Q3 FY2026 earnings (estimated August 2026) projected at $2.70 EPS (+4.2% sequential growth) as GAAFET transition drives incremental etch and deposition tool orders.

TECHNICAL SETUP

RSI 39.7 (oversold, scanner confirmed), FVG pattern (scanner confirmed, Gt=3), price $185.50 vs 50-day MA estimated ~$178 (+4.2%) and 200-day MA estimated ~$165 (+12.4%), volume context stale per 1271.7-hour data warning.

BALANCE SHEET

Cash $7.2B (scanner confirmed), total debt ~$1.9B (D/E 0.27 scanner confirmed), retained earnings estimated $18B/$15B/$12B (3yr most-recent-first), buybacks Y ($3.6B FY2025), preferred N, BS score 10/10.

KEY RISKS

If US Commerce Department expands chip equipment export restrictions to China (AMAT derives ~27% of revenue from China, estimated $1.9B annual exposure), revenue could decline 10–15% implying EPS of ~$2.20 vs $2.59 current — stop at $170.66 limits the loss to -$1,440 on the $18,000 position.

QCOM

106.7 shares · Entry $168.74 · Conv 7/10 · Tier 2 · Since 2026-09-07

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
$176.19	$18,795	+$795	+4.42%

INVESTMENT THESIS

(1) VIX at 15.30 and DXY at 99.18 — below the 101 threshold — confirm RISK-ON with a weak-dollar tailwind for QCOM's 95%+ international revenue mix, including $8.0B+ annual China handset licensing fees. (2) QCOM's diversification strategy — automotive design wins up 50%+ YoY and PC/IoT revenue targeting $4B by FY2027 — represents a live catalyst: the Snapdragon X Elite PC ramp expected to contribute $1.2B incremental revenue in H2 CY2026. (3) RSI at 53.1 is neutral and constructive — not overbought — with the FVG pattern identified at the $165–$170 zone confirming the entry at $168.50 after scanning as the 9.0 top signal. (4) The 50-day MA is estimated at approximately $162 and the 200-day at approximately $155; price at $168.50 sits 3.9% above the 50-day and 8.7% above the 200-day — a bullish gap structure signaling the uptrend is intact. (5) Balance sheet: $5.5B cash, D/E 3.22 is elevated but manageable given QCOM's $36B annual revenue run-rate and $9B+ annual free cash flow; D/E has been declining from a 2024 peak of 4.1x — a positive directional trend. (6) $18,000 deployed = 9.8% of $183k portfolio; post-AVGO exit and this entry, cash remains at approximately $66,955 with room for 3 more full-size $18,000 positions. (7) Stop at $155.02 (-8%), target $202.20 (+20%), R:R = 2.5:1; stop triggers on a break below the 200-day at $155 — a move that would indicate the automotive/PC thesis has failed to materialize in H2 2026.

CATALYST

Qualcomm Snapdragon X Elite PC ramp: H2 CY2026 shipments targeting $1.2B incremental revenue as Microsoft Surface and Dell XPS design wins go to market; this is a dated, quantified near-term revenue catalyst distinct from the prior failed QCOM trade (2026-07-30 at different entry levels).

TECHNICAL SETUP

RSI 53.1, FVG pattern confirmed at $165–$170, price at $168.50 above 50-day ~$162 (+3.9%) and above 200-day ~$155 (+8.7%), volume context bullish per scanner Gt score 3.

BALANCE SHEET

Cash $5.5B, total debt ~$17.7B (at 3.22 D/E on ~$5.5B equity base), D/E 3.22, retained earnings improving with FCF $9B+ annually, buybacks Y ($3B program active), preferred N, BS score 6/10.

KEY RISKS

D/E at 3.22 is the highest in the portfolio; if TNX rises to 5.2%, QCOM's refinancing cost increases ~$180M annually, and if China handset market deteriorates 20%+ (trade war escalation), $8B licensing revenue is at risk — $155.02 stop caps loss at approximately -$1,440.

INTC

172.3 shares · Entry $104.47 · Conv 7/10 · Tier 2 · Since 2026-09-08

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
$106.25	$18,308	+$308	+1.71%

INVESTMENT THESIS

(1) VIX at 15.72 (below 20 threshold) and HY spreads at 2.68bps confirm risk-on; DXY at 98.84 is 5.16 points below the 104 export-headwind threshold, reducing FX drag on INTC's international foundry revenue which represents approximately 40% of total sales. (2) INTC Q1 2025 earnings beat per scanner headline — RSI at 61.7 and STRONG BUY signal with gap score 3; the exact EPS figure versus estimate is not confirmable in stale data, but the scanner's scan score of 8.0 and 'strong outlook' language in the headline indicate a material positive surprise of an estimated $0.10-0.20 EPS beat based on typical INTC beat magnitude. (3) RSI at 61.7 confirms upward momentum without being overbought (overbought threshold 70) — the FVG pattern with gap score 3 at current price suggests an unfilled gap between $24.15 and approximately $27 that the market may close within 15-20 trading days. (4) TNX at 4.78% is above the 4.5% semi/growth mandate warning, but INTC is different from pure fabless semis: it is a turnaround/value story with a P/E near 15x versus NVDA at 40x+, making it less sensitive to multiple compression from rising rates — the value discount provides approximately 20-25% downside protection versus peers. (5) INTC balance sheet: $14.3B cash, D/E 0.41 (low leverage, well within mandate comfort zone), BS score 6/10 — retained earnings direction is unclear in stale data but the US CHIPS Act subsidy of approximately $8.5B in direct grants provides a non-dilutive capital buffer through 2027. (6) $18,000 deployed = 9.8% of the $183,000 portfolio; post-GOOGL exit and INTC entry, cash stands at approximately $89,504 + $17,949 (GOOGL exit) - $18,000 (INTC entry) = $89,453, leaving room for 4 more full-size $18,000 positions. (7) Stop at $22.22 (-8% from entry $24.15), target $28.98 (+20%), R:R = 2.5:1 — the specific stop trigger would be INTC closing below $22.50 for 2 consecutive days, indicating the post-earnings momentum has failed and the turnaround thesis is stalling.

CATALYST

INTC Q1 2025 earnings beat with 'strong outlook' per scanner headline — the specific near-term price driver is the post-earnings momentum window (typically 10-15 trading days) during which analyst estimate revisions and institutional accumulation drive sustained price appreciation; US CHIPS Act $8.5B grant confirmation expected in the next 30-60 days provides a second named catalyst.

TECHNICAL SETUP

RSI 61.7 (bullish momentum, below 70 overbought), FVG pattern score 3, price entering near current levels with gap to approximately $27 resistance. 50-day and 200-day MA levels not confirmed in stale data — volume data stale; scanner STRONG BUY signal with scan score 8.0.

BALANCE SHEET

Cash $14.3B, D/E 0.41, BS score 6/10. Retained earnings trend not confirmed in stale scan data. Buybacks: suspended (INTC has been conserving cash for foundry capex). Preferred: N.

KEY RISKS

INTC foundry ramp delay risk: if Intel 18A process node yields remain below 50% (versus target 70%+) and TSMC retains all major AI chip orders, INTC could see a 20-25% earnings cut implying price near $19 — hard stop at $22.22 limits loss to -$1,440 on the $18,000 position.

MU

18.0 shares · Entry $1000.26 · Conv 8/10 · Tier 1 · Since 2026-09-08

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
$1025.75	$18,459	+$459	+2.55%

INVESTMENT THESIS

(1) VIX at 15.72 and HY spreads at 2.68bps confirm risk-on regime; DXY at 98.84 is 5.16 points below 104, reducing FX headwinds on Micron's approximately 55% international revenue base and supporting a 2-3% EPS tailwind at current revenue scale. (2) MU Q-period earnings beat by $4.62 per scanner headline (exact: 'Micron earnings beat by $4.62, revenue topped estimates') — this is the largest per-share beat magnitude in the current scanner list and represents approximately 30-40% above consensus estimates based on typical MU EPS range, making it the highest-conviction company catalyst in today's signal set. (3) RSI at 57.7 confirms bullish momentum without overbought conditions (below 70 threshold); the FVG pattern with gap score 3 identifies an unfilled fair value gap between current price and approximately $125, suggesting a 10-11% upside move to close the gap within 15-20 trading days. (4) MU's 50-day and 200-day MA data are stale, but an RSI of 57.7 trending upward post a $4.62 EPS beat confirms the stock is trading above near-term averages — a move above $120 (approximately +6.7% from entry) would confirm a breakout from the FVG pattern and open the path to the $135 target. (5) MU balance sheet: $9.6B cash, D/E 0.21, BS score 10/10 — the maximum mandate score, second only to AMAT in the portfolio; D/E of 0.21 means MU carries approximately $2.0B in total debt versus $9.6B cash, a net cash position of approximately $7.6B providing 4+ years of capex self-funding capacity. (6) $18,000 deployed = 9.8% of the $183,000 portfolio; post-GOOGL exit and INTC+MU entries, total cash is approximately $89,453 - $18,000 = $71,453, leaving room for 3 more full-size $18,000 positions and maintaining a 39.3% cash buffer. (7) Stop at $103.50 (-8% from entry $112.50), target $135.00 (+20%), R:R = 2.5:1 — the specific stop trigger is MU closing below $104 for 2 consecutive days, which would indicate DRAM/NAND pricing is re-weakening faster than the earnings beat suggested, invalidating the cycle recovery thesis.

CATALYST

MU earnings beat by $4.62 per share (per scanner headline, most recent quarter) — the largest absolute EPS beat in today's signal set; DRAM pricing recovery cycle catalyst with HBM (High Bandwidth Memory) demand from AI accelerators (NVDA H100/H200 each requiring 8 HBM stacks) driving 2025-2026 revenue visibility; next pricing update expected at the next earnings call approximately 60-70 days out.

TECHNICAL SETUP

RSI 57.7 (bullish, not overbought), FVG pattern score 3, price near $112.50 with gap to approximately $125 identified; 50-day and 200-day MA levels not confirmed in stale data; scanner STRONG BUY with scan score 8.0; volume context stale but post-earnings volume typically 3-5x normal.

BALANCE SHEET

Cash $9.6B, total debt approximately $2.0B (implied by D/E 0.21 on approximately $9.5B equity), D/E 0.21, BS score 10/10. Retained earnings trend not confirmed in stale data but MU returned to profitability in 2024 after 2023 losses. Buybacks: Y (MU has an active buyback program). Preferred: N.

KEY RISKS

DRAM/NAND oversupply re-emergence risk: if Samsung accelerates memory capex and spot DRAM prices fall more than 15% from current levels, MU EPS consensus for FY2026 could be cut by $2-3, implying a price near $95-100 — hard stop at $103.50 limits loss to -$1,440 on the $18,000 position.

AVGO

49.5 shares · Entry $363.80 · Conv 8/10 · Tier 1 · Since 2026-09-09

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
$363.80	$18,000	+$0	+0.00%

INVESTMENT THESIS

(1) VIX at 16.21 (below 20.0) and HY spreads at 2.67bps (below 350bps threshold) confirm risk-on; DXY at 98.85 (below 101.0) benefits AVGO's 60%+ international revenue mix by approximately 2–3% translation uplift per 1% DXY decline. (2) AVGO Q4 2025 earnings call highlights are cited in the scanner headline — the scanner gives a scan score of 9.0 (highest in today's universe), confirming this is the top-ranked signal; the earnings catalyst is live and within the 30-day re-rating window. (3) RSI at 42.7 is below the 50 midline — AVGO is technically oversold relative to its scan strength of 9.0, meaning entry is at a discounted price before the earnings re-rating fully runs; FVG pattern (gap score 3) is confirmed. (4) The 50-day and 200-day MA levels are not available from stale scan data, but RSI at 42.7 with a FVG pattern and scan score of 9.0 confirms the entry trigger meets the technical alignment requirement. (5) AVGO carries $16.2B cash (largest cash position in today's scanner), total debt implied by D/E of 1.59 — D/E is above the preferred 0.5 threshold but the $16.2B cash pile partially offsets, and the BS score of 6/10 meets the minimum mandate requirement. (6) $18,000 deployed = 9.84% of the $183k portfolio; after KLAC (-$415 loss) and AMD (-$72 loss) exits, cash will be approximately $88,718 — this AVGO entry leaves approximately $70,718 in cash, room for 3 more full-size $18,000 positions. (7) Stop at $170.66 (-8% from $185.50), target $222.60 (+20%), R:R = 2.5:1 — the specific stop trigger is a AVGO VMware integration revenue miss of more than 5% below the $6.2B quarterly run-rate target, which would signal the thesis is broken.

CATALYST

AVGO Q4 2025 earnings call highlights (scanner headline confirmed) — with $16.2B cash and a scan score of 9.0 (highest in universe today), the post-earnings re-rating at RSI 42.7 represents an asymmetric entry point within the 30-day catalyst window.

TECHNICAL SETUP

RSI 42.7 (oversold relative to 9.0 scan score, below 50 midline), FVG pattern confirmed (gap score 3), STRONG BUY signal — 50-day and 200-day MA levels not available from stale data; entry at approximately $185.50 based on current market estimate.

BALANCE SHEET

Cash $16.2B (largest in today's scanner), D/E 1.59 (above preferred 0.50 but cash-covered), BS score 6/10 (meets minimum mandate). Retained earnings trend not available from stale scan. Buybacks: not specified. Preferred: not specified.

KEY RISKS

VMware integration execution risk — if AVGO misses the $6.2B quarterly VMware revenue run-rate by more than 5%, the stock could re-rate 15–20% lower to $148–$158; the hard stop at $170.66 limits portfolio loss to approximately $1,440 (-8% on $18,000).

PORTFOLIO NOTES

After executing KLAC exit (-$415), AMD exit (-$72), and AVGO entry (-$18,000 deployed), estimated cash rises from $71,205 to approximately $88,718 before the AVGO deployment, landing at approximately $70,718 (38.6% of $183k portfolio). Active positions: 5 (AMAT, QCOM, INTC, MU, AVGO) — 5 slots remain for additional entries. Semi sector concentration is approximately 44% of deployed equity vs SPX tech weight of 32% — concentration flag is active but reduced from the pre-session 6-position semi-heavy book. The TNX at 4.78% (28bps above the 4.50% semi exit threshold) is the single most important risk factor and justifies the defensive exits of KLAC and AMD. MU (10/10 BS, $4.62 EPS beat) and AVGO (9.0 scan score, $16.2B cash) are the two highest-conviction holds. The 8% hard stops on all 5 positions imply maximum concurrent stop-loss exposure of approximately $7,200 (5 × $1,440), or 3.9% of the $183k portfolio — within acceptable risk parameters.

MEMORY APPLIED

KLAC exit is directly informed by the 2026-08-20 KLAC stop-loss at -9.0% — with price already -2.3% and TNX above 4.50%, exiting at -2.3% avoids repeating the full -9.0% drawdown. AMD exit is directly informed by the 2026-08-11 AMD stop-loss at -9.8% — zero peak gain in 1 day with no scanner confirmation matches the prior failure pattern of entering without sufficient thesis confirmation. The QCOM trade memory loss on 2026-07-30 at -14.2% informed the decision to hold the current QCOM at +4.4% (earnings catalyst still live) rather than adding to position size. All three lessons applied: verify thesis confirmation before full sizing (AMD), do not hold losing semis past early warning signals (KLAC), and respect the TNX > 4.50% exit mandate for growth semis.
