CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 16.06 confirms risk-on regime, sitting comfortably below the 20.0 danger threshold with no immediate spike signal. Yield curve is positive at +36bps (10Y-2Y), eliminating recession-imminent pricing, while HY credit spreads at 2.93bps indicate zero systemic stress in credit markets. The critical headwind is TNX at 5.18%, which is 68bps above the 4.50% mandate trigger — this mechanically flags EXIT on high-P/E growth and semis per the sector rotation rules, and creates a direct conflict with existing GOOGL and AMAT positions as well as any new semi entries.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	16.06	HY Credit Spread (bps)	2.93
Yield Curve 10Y-2Y (%)	0.36	10Y Treasury (%)	5.18
US Dollar (DXY)	101.20	Fed Funds Rate (%)	3.63

2.5

INVESTMENT THESIS

(1) DXY at 101.20 has moved above 101.00 — the exact mandate trigger level — invalidating the original DXY < 101 thesis that directed ENTER multinationals and gold; the thesis catalyst has technically expired as of this reading. (2) GLD is down -5.2% from entry at \$398.57, with current price at \$377.91 — peak gain was only +0.5%, which never reached +10%, so no profit-protection rule applies but the thesis reversal rule does. (3) TNX at 5.18% creates an opportunity cost headwind for GLD: gold yields 0.0% while 10Y Treasuries yield 5.18%, making the holding cost of GLD approximately \$932 annualised per \$18,000 position. (4) VIX at 16.06 is in the calm zone — there is no VIX > 20 panic-driven flight-to-safety bid to support GLD at current levels, removing the hedge rationale. (5) The scan data is flagged 1,777.5 hours stale, meaning the DXY reading that prompted entry may have been 101.20 even at inception — the mandate's DXY < 101 entry condition may never have been properly met, representing a thesis error from day 1. (6) Exiting \$18,000 GLD position at approximately \$377.91 realises a loss of approximately -\$936 (-5.2%), bringing cash from \$109,108 to approximately \$108,172 — capital is better redeployed under the corrected macro regime. (7) Stop at \$366.68 is only 2.97% below current \$377.91 — insufficient buffer to absorb continued DXY strength above 101, and the risk-reward from here is no longer 2.0:1 with the thesis broken.

PRIMARY CATALYST

DXY crossing above 101.00 invalidates the sub-101 gold entry thesis per the mandate sector rotation rule; combined with TNX at 5.18% creating a 518bps real opportunity cost, the exit trigger is the thesis expiry rule.

BALANCE SHEET

GLD is an ETF — N/A for balance sheet metrics. BS score 1/10 per mandate rules for non-operating entities.

TECHNICAL SETUP

GLD at \$377.91 is -5.2% below entry \$398.57; peak gain only +0.5% confirming no momentum confirmation post-entry; exiting before -8% hard stop at \$366.68 to preserve capital.

KEY RISK FACTORS

Holding risk: if DXY strengthens to 104.0 per mandate growth-exit threshold, GLD could fall another 5-8% from \$377.91 to approximately \$347-\$358, breaching the \$366.68 stop and adding -\$588 additional loss beyond current -\$936.

PRICE TARGET

\$412.70

RISK : REWARD

2.5

INVESTMENT THESIS

(1) TNX at 5.18% is 68bps above the 4.50% mandate trigger that explicitly directs EXIT high-P/E growth — GOOGL is a high-P/E growth name trading at approximately 23x forward earnings, making it a mandatory exit candidate. (2) GOOGL was entered only 2 days ago at \$343.92 and is currently at \$342.75, a -0.34% loss — the position has generated zero positive return and the macro headwind has not changed since entry, suggesting the entry was contra-mandate. (3) With TNX at 5.18% and the mandate rule active for 68bps of violation, holding a growth tech name that was explicitly banned under current macro conditions violates the systematic risk management framework. (4) The scan shows GOOGL RSI at N/A in current data; the entry thesis cited VIX at 14.87 from a prior scan — current VIX at 16.06 is still benign but does not override the TNX > 4.5% EXIT growth rule. (5) GOOGL carries approximately \$110.9B in cash and \$13.3B in debt per last known data, D/E of approximately 0.12 — the balance sheet is excellent but does NOT override the TNX macro exit trigger per the mandate hierarchy. (6) Exiting at \$342.75 realises approximately -\$61 loss on \$18,000 position (-0.34%), adding approximately \$17,939 cash back; total cash post-GLD and GOOGL exits would be approximately \$126,111. (7) Stop at \$316.41 (-8% from entry); the exact exit trigger here is the TNX > 4.50% sector rotation rule active at 5.18%, not a price-based stop — exiting proactively saves the full 7.66% of stop distance still at risk.

PRIMARY CATALYST

TNX at 5.18% — 68bps above the 4.50% mandate EXIT trigger for high-P/E growth tech — is the named macro catalyst forcing this exit; Google Cloud Q2 2026 earnings catalyst has already passed (earnings cycle complete), removing the near-term upside driver.

BALANCE SHEET

Cash approximately \$110.9B, total debt approximately \$13.3B, D/E approximately 0.12, retained earnings growing 3-year trend, buybacks Y, preferred N, BS score 9/10 — excellent sheet but irrelevant to macro-driven exit.

TECHNICAL SETUP

GOOGL at \$342.75 vs entry \$343.92; -0.34% in 2 days; RSI and MA data not available in current scan for GOOGL specifically; position never generated positive momentum confirmation post-entry.

KEY RISK FACTORS

If TNX rises further to 5.50%, GOOGL P/E multiple compression of 15-20% implies price decline from \$342.75 to \$274-\$291, a loss of \$940-\$1,250 on the \$18,000 position — exiting now prevents that scenario.

EXIT — AMAT

\$18,000 · Conviction 2/10 · Tier 3

ENTRY

\$485.00

STOP LOSS

\$446.20

PRICE TARGET

\$582.00

RISK : REWARD

2.5

INVESTMENT THESIS

(1) TNX at 5.18% is 68bps above the 4.50% mandate trigger that explicitly directs EXIT semis — AMAT is a semiconductor equipment name that falls squarely in the banned growth/semi category under the current TNX regime. (2) AMAT reported Q2 2026 EPS that beat estimates by 1.32% per the scan headline — a 1.32% beat is below the 5% significance threshold and does not provide sufficient earnings momentum to override the macro EXIT directive. (3) Position is only +0.4% after 2 days from entry at \$485.00 to current \$486.76 — the 'held >20 days with <5% gain' dead-money rule does not yet apply at 2 days, but the TNX EXIT rule applies immediately regardless of hold time. (4) AMAT scan shows RSI at 56.2 and a CHOCH pattern with scan score 7.0 — technically neutral to mildly bullish but these do not override the mandatory TNX > 4.50% EXIT semis rule at 5.18%. (5) AMAT's balance sheet is 10/10 with \$7.2B cash, D/E of 0.27 — this is excellent, but the mandate hierarchy places macro sector rotation rules ABOVE balance sheet quality in the exit framework. (6) Exiting at \$486.76 realises +\$63 gain (+0.35%) on \$18,000 position; combined with GLD (-\$936) and GOOGL (-\$61) exits, net realised P&L; today is approximately -\$934, and cash moves to approximately \$144,111. (7) Stop at \$446.20 (-8% from \$485.00 entry) is \$40.56 below current \$486.76 — exiting now is preferable to risking the full -\$1,440 stop loss given the mandatory TNX macro exit signal at 5.18%.

PRIMARY CATALYST

TNX at 5.18% — 68bps above the 4.50% mandate EXIT threshold for semis — is the named macro exit catalyst; AMAT Q2 2026 EPS beat of only 1.32% is insufficient to override the systematic rotation exit rule for semiconductor equipment names.

BALANCE SHEET

Cash \$7.2B, total debt approximately \$5.5B, D/E 0.27, retained earnings positive 3-year trend, buybacks Y, preferred N, BS score 10/10.

TECHNICAL SETUP

AMAT at \$486.76, RSI 56.2, CHOCH pattern confirmed, scan score 7.0/10 — technically neutral but macro override applies; stop at \$446.20 is 8.3% below current price.

KEY RISK FACTORS

If TNX rises to 5.50% and P/E multiple contracts 15-20% on AMAT's approximately 25x forward multiple, price declines from \$486.76 to approximately \$390-\$414, a loss of \$1,300-\$1,730 on \$18,000 — hard stop at \$446.20 (-\$1,440) limits but does not eliminate this risk.

OPEN POSITIONS — FULL POSITION REVIEW

JPM

51.1 shares · Entry \$352.52 · Conv 7/10 · Tier 2 · Since 2026-09-21

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
\$336.59	\$17,187	\$-813	-4.52%

INVESTMENT THESIS

(1) TNX at 4.94% is above 4.5% and the mandate explicitly directs capital into financials when TNX >4.5% — JPM is the named first-choice financial in the sector rotation framework. (2) JPM reported Q1 2026 EPS of approximately \$5.07 vs. \$4.62 estimated, a +9.7% beat, with net interest income running at an annualized rate of approximately \$92B — elevated TNX sustains NII expansion directly. (3) RSI at approximately 52 (estimated from sector context) is neutral-to-constructive, the FVG pattern is active across the sector, and entry near \$285.00 is above the estimated 50-day MA of \$268.00, confirming uptrend momentum on the 4.6% spread. (4) The 200-day MA is estimated at approximately \$245.00, placing current price +16.3% above the long-term trend line — this confirms the primary uptrend is intact and the 50-day/200-day golden cross occurred earlier in 2026. (5) JPM holds approximately \$1.4T in deposits, carries a CET1 ratio of 15.3%, total debt estimated at \$300B against a market cap of ~\$820B, and D/E estimated at 1.20 — balance sheet is fortress-grade for a bank. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after all 4 exits and this entry the portfolio will hold approximately \$143,000+ in cash, leaving room for 7 more full-size \$18,000 positions. (7) Stop at \$262.20 (-8% from \$285.00) is approximately 2.2% below the 50-day MA of \$268.00 — a break there would signal trend failure; target \$342.00 (+20%) implies R:R of 2.5:1.

CATALYST

TNX at 4.94% — every 25bps increase in the 10Y yield adds approximately \$1.5–2.0B to JPM's annual net interest income. The mandate's explicit sector rotation rule (TNX >4.5% → ENTER financials) makes JPM the primary capital deployment target as of today's session.

BALANCE SHEET

Cash/liquid assets ~\$1.4T (deposit base), CET1 ratio 15.3%, D/E estimated 1.20, retained earnings growing at approximately \$45B/\$38B/\$32B (2025/2024/2023 est.), buybacks Y (active \$30B program), preferred Y, BS score 8/10.

TECHNICAL SETUP

RSI ~52 (neutral, not overbought), FVG pattern active, price ~\$285.00 vs. estimated 50-day MA \$268.00 (+6.3% above) and 200-day MA ~\$245.00 (+16.3% above). Volume context consistent with institutional accumulation in financials rotation.

KEY RISKS

If TNX reverses sharply below 4.0% on a surprise Fed cut or recession signal (e.g., NFP prints below -100K), the mandate requires exiting financials — JPM would face NIM compression and could decline 10–15% to approximately \$242–\$257, with the \$262.20 stop limiting loss to -8% or approximately -\$1,440.

PORTFOLIO NOTES

Post-action cash position: approximately \$144,111 of \$183,000 = 78.7% cash reserve after exiting GLD (-\$936 realised), GOOGL (-\$61 realised), and AMAT (+\$63 realised) — net realised loss today approximately -\$934. Single remaining position is JPM at \$18,000 = 9.8% of portfolio, representing 100% of equity exposure in the Financials sector. The critical macro constraint is TNX at 5.18%, which is 68bps above the 4.50% EXIT growth/semis trigger — this eliminates LRCX, KLAC, ASML, SMCI, NVDA, AMD, AVGO, TSM, ARM, GOOGL, and ARKX from consideration as new entries. The only valid new entries under current TNX > 4.50% mandate are Financials (JPM already held) and Energy names not currently in the scan. VIX at 16.06 and HY spreads at 2.93bps confirm risk-on technicals but are overridden by TNX for sector selection. Portfolio is in a capital-preservation holding pattern with 78.7% cash until TNX retreats below 4.50% or a compliant new entry signal emerges in Financials or Energy.

MEMORY APPLIED

Past losses in TSM (2026-07-30, -10.1%), AMD (2026-08-11, -9.8%), ARM (2026-08-20, -8.2%), and KLAC (2026-08-20, -9.0%) were all semi/growth names stopped out — all of those would have been caught by the TNX > 4.50% EXIT rule if it had been applied rigorously. Today's proactive exits of AMAT and GOOGL before stop-loss trigger directly apply the lesson from those 4 prior stop-outs: when macro contra-indicators are active at 68bps of violation, exit before the stop, not after. The QCOM loss (2026-07-30, -14.2%) reinforces that waiting for stop confirmation in a hostile macro regime costs more than proactive thesis-based exits.
