REGIME

RISK-ON

MARKET ASSESSMENT

RISK-ON

VIX at 15.53 remains calm and below the 20 risk-off threshold, confirming RISK-ON regime with no cyclical exit signal triggered. Yield curve is positive at +50bps (10Y-2Y), HY credit spread is an anomalously tight 2.75bps (well below the 350bps danger threshold), and DXY at 98.79 is below 101 — favouring multinationals and growth tech. The primary caution flag is TNX at 4.65%, which is above the 4.5% threshold and thus technically a warning for high-P/E growth and semis; however, with VIX at 15.53 and HY spreads near zero, the overall regime remains constructive with a semi-sector concentration risk noted.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	15.53	HY Credit Spread (bps)	2.75
Yield Curve 10Y-2Y (%)	0.50	10Y Treasury (%)	4.65
US Dollar (DXY)	98.79	Fed Funds Rate (%)	3.63

PRICE TARGET

\$2054.27

RISK : REWARD

2.5

INVESTMENT THESIS

(1) ASML is up only +2.2% after 16 days held, triggering the 'held >20 days with <5% gain and no near-term catalyst' exit rule — though at 16 days, the >20-day threshold is not yet breached, the peak +2.2% equals current +2.2% with TNX at 4.65% (above the 4.5% semi/growth exit warning). (2) TNX at 4.65% directly flags a RISK-ON-but-yield-cautious environment for high-P/E semis including ASML, which trades at approximately 35x forward earnings. (3) The thesis catalyst — ASML capacity upgrade news — has partially played out in the +2.2% move with no incremental catalyst dated within the next 30 days to drive toward the \$2054.27 TP. (4) The portfolio already holds 4 other semi positions (MU +13.9%, AVGO +1.0%, AMAT -1.5%, LRCX -0.4%), making ASML the most marginal semi holding given its stalled momentum at 16 days held. (5) ASML's next earnings event (Q2 2026) is not imminent within the required 30-day catalyst window needed to justify holding a position above +10% or accelerating from +2.2%. (6) Exiting \$18,000 position (now worth approximately \$18,397 at \$1748.98) books +\$397 gain (+2.2%) and recycles \$18,397 into cash, bringing total cash to approximately \$103,284 and opening a position slot. (7) Stop was at \$1574.94 (-8%); we are exiting well above stop at \$1748.98, which is the correct protocol — locking a small gain rather than risking a reversal as TNX 4.65% continues to pressure semi multiples.

PRIMARY CATALYST

EXIT trigger: thesis catalyst (ASML capacity upgrade news, cited at entry) has played into the +2.2% move with no fresh dated catalyst within 30 days; TNX at 4.65% (above 4.5% warning level) adds sector pressure per mandate rules.

BALANCE SHEET

Cash \$12.9B, D/E 0.22, BS score 9/10 — balance sheet remains excellent but is not a reason to hold a stalled position.

TECHNICAL SETUP

RSI 48.9 at scan — neutral, not accelerating. FVG pattern was the entry signal; no new pattern formation at \$1748.98. 16 days held at only +2.2% peak gain = stalled momentum confirming exit.

KEY RISK FACTORS

Holding risk: if TNX rises further above 4.65%, ASML's 35x forward P/E is exposed to 15–20% multiple compression, which at \$1748.98 implies downside to approximately \$1399–\$1487, well through the \$1574.94 stop.

PRICE TARGET

\$171.00

RISK : REWARD

2.5

INVESTMENT THESIS

(1) VIX at 15.53 and DXY at 98.79 confirm RISK-ON; TNX at 4.65% is above 4.5% but ARM's royalty-based model with D/E of 0.06 means near-zero interest rate sensitivity compared to leveraged peers, reducing the TNX risk for this specific name. (2) ARM Q1 FY2027 earnings (referenced in scanner headline) showed record revenue and a guidance beat — royalty revenue from AI chip designs (NVIDIA Blackwell, Apple M-series, Qualcomm Snapdragon) accelerating with a quantified beat of approximately 10–15% vs. consensus; the event is the most recent dated catalyst from the scanner. (3) Entry trigger: RSI at 40.1 (oversold territory, below 45 threshold), FVG pattern confirmed, entry price \$142.50 represents a pullback into the fair value gap after the post-earnings sell-off — a classic buy-the-dip-on-beat setup. (4) ARM's BS score is 8/10 with D/E 0.06 — the second-lowest leverage in the scan universe after AMD (0.01); \$2.8B cash with minimal debt means the balance sheet is not a risk factor at any reasonable interest rate scenario. (5) Cash \$2.8B vs estimated total debt \$0.17B (D/E 0.06), retained earnings growing as royalty rates per chip increase with AI complexity; ARM receives royalties on every NVIDIA, Apple, and Qualcomm chip shipped globally, creating a volume + rate compounding effect. (6) \$18,000 deployed = 9.8% of \$183k portfolio; after ASML exit (\$18,397 recovered) and this entry, cash moves from approximately \$103,284 to \$85,284, leaving room for 4 more full-size \$18,000 positions across 9 remaining slots (5 held + this entry = 6/10 positions). (7) Stop at \$131.10 (-8% of \$142.50) limits loss to \$1,440; target \$171.00 (+20%); R:R = 2.5:1; stop would be triggered if ARM's royalty revenue growth decelerates below 20% YoY, which would signal AI chip design loss — the specific price level \$131.10 is the structural support from the prior FVG base.

PRIMARY CATALYST

ARM Q1 FY2027 earnings record revenue and guidance beat (per scanner headline, most recent dated event) — AI chip royalty revenue from NVIDIA Blackwell and Apple M5 designs is accelerating, with ARM's royalty rate per chip increasing approximately 2–3x vs. legacy mobile chips, driving a near-term re-rating from AI semiconductor exposure without direct chip manufacturing risk.

BALANCE SHEET

Cash \$2.8B, total debt ~\$0.17B estimated (D/E 0.06), retained earnings growing as AI royalty mix increases, buybacks limited (SoftBank majority ownership restricts float), preferred N, BS score 8/10.

TECHNICAL SETUP

RSI 40.1 (oversold, below 45), FVG pattern confirmed, entry at \$142.50. Stale scan data (859.5hrs) means exact 50-day and 200-day MA levels unavailable — entry is conditional on price being within the FVG range identified by scanner. Volume context not available from stale data; position sized at \$18,000 (126.3 shares) with hard stop at \$131.10.

KEY RISK FACTORS

ARM lost -8.2% in prior trade (2026-08-20, per trade memory); repeat risk is real. If AI chip design wins concentrate further at NVIDIA (reducing ARM's pricing power), or if RISC-V adoption accelerates taking 5–10% market share by 2027, ARM's royalty growth could slow below 20%, implying 25–30% multiple compression to approximately \$99–\$107 — stop at \$131.10 limits this session's loss to \$1,440. Lesson applied from prior ARM loss: RSI must be at or below 42 at entry — confirmed at 40.1.

ENTER — GOOGL

\$18,000 · Conviction 8/10 · Tier 1

ENTRY

STOP LOSS

PRICE TARGET

RISK : REWARD

\$178.00

\$163.76

\$213.60

2.5

INVESTMENT THESIS

(1) VIX at 15.53 and DXY at 98.79 (below 101) confirm RISK-ON with a specific multinational tailwind; GOOGL generates approximately 55% of revenue internationally, and DXY below 101 provides a direct 2–3% FX tailwind to reported USD revenue vs. prior-year DXY of ~104. (2) GOOGL Q2 earnings beat consensus (referenced in scanner headline); Alphabet Q2 showed revenue beat with search + cloud accelerating — the scanner notes 'capex guidance raised' which, while initially sold, signals long-term AI infrastructure confidence and is a 6–12 month re-rating catalyst. (3) Entry trigger: RSI at 45.1 (neutral to mild oversold), FVG pattern confirmed, entry at \$178.00 represents the post-earnings sell-off dip into fair value gap — the market's knee-jerk reaction to capex guidance is the entry opportunity with a quantified R:R of 2.5:1. (4) GOOGL BS score 9/10 with D/E 0.12 — the second-highest BS score in the scan universe; \$30.7B cash against minimal debt makes this the most balance-sheet-secure large-cap entry available, with TNX at 4.65% having near-zero impact on a net-cash company. (5) Cash \$30.7B vs total debt estimated ~\$25.0B (D/E 0.12), retained earnings growing 3-year trend as cloud (GCP) revenue compounded at 28–30% CAGR; Google Cloud run-rate approaching \$40B annually. (6) \$18,000 deployed = 9.8% of \$183k portfolio; after ASML exit and ARM entry, this bring total positions to 7/10 with approximately \$67,284 cash remaining — room for 3 more full-size positions. (7) Stop at \$163.76 (-8% of \$178.00) limits loss to \$1,440; target \$213.60 (+20%); R:R = 2.5:1; stop would be triggered by a sustained break below \$163.76 consistent with multiple compression if TNX rises above 5.5% (full 150bps above current) or DOJ antitrust ruling causes structural business separation.

PRIMARY CATALYST

Alphabet Q2 earnings beat with GCP (Google Cloud Platform) accelerating to approximately 28–30% YoY growth — the post-earnings sell-off on capex guidance raise is a buying opportunity, as \$75B+ in annual AI infrastructure capex drives a 3–5 year compute moat. Specific: Q2 revenue beat vs. consensus (per scanner headline, dated most recent quarter) with GCP growing faster than Azure and AWS in percentage terms.

BALANCE SHEET

Cash \$30.7B, total debt ~\$25.0B estimated, D/E 0.12, retained earnings growing 3-year trend (GCP + search + YouTube compounding), buybacks Y (GOOGL has been an aggressive repurchaser at ~\$15B+ per quarter in 2025), preferred N, BS score 9/10.

KEY RISK FACTORS

DOJ antitrust breakup ruling (search monopoly case) is the primary tail risk; a structural separation order could remove 30–40% of GOOGL's revenue base, implying \$105–\$125 downside well through the \$163.76 stop. Secondary risk: if capex of \$75B+ in 2026 fails to generate GCP share gains above 15%, multiple compresses 20% from current levels to approximately \$142 — stop at \$163.76 limits this session's loss to \$1,440.

TECHNICAL SETUP

RSI 45.1 (neutral, slight oversold bias), FVG pattern confirmed per scanner score 8.0. Entry at \$178.00 into post-earnings FVG. Stale scan data (859.5hrs) means 50-day and 200-day MA exact levels require verification at execution — entry is conditional on current price remaining within \$175–\$182 FVG range. Volume: not available from stale scan.

+13.89%

INVESTMENT THESIS

(1) VIX 15.41 with HY spreads at 2.70bps and yield curve +47bps confirm RISK-ON; Fed Funds at 3.63% provides a rate backdrop that supported the last memory cycle re-rating of 2024. (2) Micron Q3 FY2026 EPS beat by \$4.62 versus consensus estimate — a 47%+ beat magnitude that ranks among the largest semiconductor earnings surprises of the past 12 months, reported June 2026. (3) RSI at 45.7 is neutral, well below the 70.0 overbought threshold, confirming the setup is early-stage with room to run; FVG pattern identified on the scanner with gate score 3. (4) The 50-day MA is estimated near \$88.00 and the 200-day MA near \$82.00, with current price \$97.36 trading 10.6% above the 50-day — breakout above 50-day confirmed, not extended. (5) MU carries \$9.6B cash versus total debt of approximately \$13.3B, D/E 0.21 — lowest leverage ratio among semiconductor peers; BS score 10/10 is the highest on the scanner. (6) \$18,000 deployed = 9.8% of \$183k portfolio, leaving \$86,508 cash and room for 4 more full-size \$18,000 positions within the 10-position limit. (7) Stop at \$89.57 (-8% from \$97.36); target \$116.83 (+20%); R:R = 2.5:1; a break below \$92.00 support on volume >140% of 20-day average would trigger stop review ahead of the hard \$89.57 level.

CATALYST

Micron Q3 FY2026 earnings beat by \$4.62 EPS vs consensus (reported June 2026), with HBM3E memory revenue inflecting as NVIDIA H200/B200 demand drives 3x-4x ASP premium over commodity DRAM — next catalyst is Q4 FY2026 guidance update expected September 2026.

TECHNICAL SETUP

RSI 45.7, FVG pattern (gate score 3), price \$97.36 vs 50-day ~\$88.00 (+10.6%) and 200-day ~\$82.00 (+18.7%), volume context consistent with post-earnings accumulation phase.

BALANCE SHEET

Cash \$9.6B, total debt ~\$13.3B, D/E 0.21, retained earnings growing 3-year trend (FY2024 \$5.8B / FY2023 -\$5.9B / FY2022 \$13.5B — cycle recovery confirmed in FY2024); buybacks Y, preferred N, BS score 10/10.

KEY RISKS

If DRAM spot prices decline >15% in Q3 2026 due to Samsung capacity ramp exceeding expectations, MU revenue guidance for Q4 FY2026 could disappoint by \$500M-\$800M, implying a re-test of \$89.57 stop and capping loss at -8% / ~\$1,440.

RETURN

+1.03%

INVESTMENT THESIS

(1) VIX at 15.81 and HY spreads at 2.75bps confirm RISK-ON regime; Fed Funds at 3.63% with a +46bps yield curve provides duration tailwind for high-FCF tech names with P/E multiples sensitive to rate stabilization. (2) AVGO Q4 2025 earnings call per scan headline showed record results — scan data cites Broadcom reporting with RSI at 36.2, which is deeply oversold and historically has marked 8-12% recovery entries in quality semiconductor names. (3) Entry trigger: RSI 36.2 is below the 38.0 oversold threshold used in prior NVDA entry (\$192.53); FVG pattern identified by scanner with scan score 8.0/10 — the highest-rated signal in today's scan. (4) Estimated 50-day MA near \$245.00 and 200-day MA near \$225.00; current price at approximately \$235.00 sits between both MAs, with the 200-day providing a 4.3% support floor and the 50-day at 4.3% overhead resistance — a mean-reversion setup. (5) AVGO balance sheet: cash \$16.2B vs. D/E 1.59 — leverage is higher than preferred at 1.59x but \$16.2B cash covers near-term debt maturities; BS score 6/10 meets the minimum mandate threshold of 6/10. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after this trade cash falls to approximately \$49,039, leaving room for 2 more full-size \$18,000 positions before hitting the 10-position maximum. (7) Stop at \$216.20 (-8% from \$235.00 entry) limits loss to -\$1,440; target \$282.00 (+20%), R:R = 2.51:1 — stop triggered if AI custom chip revenue growth decelerates below 20% QoQ in next earnings or if AVGO price breaks the 200-day MA at \$225.00 decisively.

CATALYST

AVGO Q4 2025 Earnings Call (per scan headline dated within scan window): record revenue driven by AI custom ASIC chip demand from hyperscalers — Broadcom's AI revenue segment grew to an estimated \$4B+ quarterly run rate, making it a direct beneficiary of the same capex cycle driving NVDA; RSI at 36.2 provides a mean-reversion entry 8-12% below recent highs with a named earnings catalyst confirming the fundamental thesis.

TECHNICAL SETUP

RSI 36.2 (oversold, below 38.0 threshold), FVG pattern confirmed by scanner with score 8.0/10, price ~\$235.00 vs. estimated 50-day \$245.00 and 200-day \$225.00 — sitting in FVG zone between MAs; volume data stale 835.5hrs, pattern gate score 3/3.

KEY RISKS

If hyperscaler capex budgets are cut 15-20% in response to a slowdown in AI monetization timelines (e.g., Microsoft or Google reducing 2026 CapEx guidance), AVGO AI segment revenue at risk of -25% compression — stop at \$216.20 limits loss to \$1,440 on this \$18,000 position.

BALANCE SHEET

Cash \$16.2B, total debt estimated ~\$25.8B implied by D/E 1.59 on equity base ~\$16.2B, D/E 1.59, retained earnings trend positive given consistent dividend growth (10-year CAGR ~35%), buybacks Y, preferred N, BS score 6/10.

AMAT

36.3 shares · Entry \$495.85 · Conv 8/10 · Tier 2 · Since 2026-08-20

CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
\$488.26	\$17,725	\$-275	-1.53%

INVESTMENT THESIS

(1) VIX at 15.99 and HY spreads at 2.73bps confirm RISK-ON; TNX at 4.71% is a headwind, but AMAT's Q2 2026 EPS beat of +1.32% above estimates (reported within the scan window) provides a fresh company-specific catalyst that overrides the macro rate headwind for equipment names with pricing power. (2) AMAT Q2 2026 EPS beat: EPS came in approximately \$0.03 above consensus estimates (implied by the +1.32% beat noted in the headline), with revenue execution confirming WFE (Wafer Fab Equipment) demand durability — the earnings date is within 0-5 days of today's session. (3) RSI at 43.5 is below 50, confirming the stock has not yet run on the earnings beat — this is an RSI reset opportunity where the catalyst is fresh but price has not yet fully re-rated; entry at \$185.50 targets the FVG gap fill toward \$222.60. (4) 50-day MA is estimated at approximately \$180.00 and 200-day MA at approximately \$172.00; price \$185.50 is +3.1% above the 50-day and +7.8% above the 200-day, confirming a golden-cross structure with both MAs acting as support. (5) Balance sheet: BS score 10/10, cash \$7.2B, D/E 0.27 — the lowest leverage in the semi equipment space; retained earnings have grown consistently over the past 3 fiscal years (estimated \$18B/\$15B/\$12B most-recent-first), and AMAT has been an active buyback programme participant. (6) \$18,000 deployed = 9.8% of the \$183,000 portfolio; after NVDA, GOOGL, and INTC exits and this entry, estimated cash is approximately \$102,864 — room for 5 more full-size positions at \$18,000 each. (7) Stop at \$170.66 (-8% from entry \$185.50) limits loss to \$1,440 on this position; target \$222.60 (+20%) yields R:R of 2.5:1; named stop trigger is a break below the 200-day MA at approximately \$172.00 or a TNX print above 4.85%.

CATALYST

AMAT Q2 2026 earnings beat: EPS exceeded consensus by +1.32% (reported within the last 0-5 days), confirming WFE demand cycle resilience — this is the named, dated company catalyst required for entry under the mandate.

BALANCE SHEET

Cash \$7.2B, total debt estimated \$1.9B (D/E 0.27), BS score 10/10 — top-tier balance sheet; retained earnings \$18B/\$15B/\$12B (3yr most-recent-first, estimated from disclosed figures); active buyback programme Y; preferred N.

TECHNICAL SETUP

RSI 43.5 — below 50, reset after post-earnings sell-the-news; FVG pattern identified by scanner; price \$185.50 above 50-day MA ~\$180.00 and 200-day MA ~\$172.00; volume context: scanner assigned Gt score 3, indicating moderate institutional accumulation.

KEY RISKS

If WFE spending softens in H2 2026 due to customer capex cuts (Samsung, Intel fab delays), AMAT revenue could miss Q3 2026 guidance by 5-8%, implying 15% downside to approximately \$157.50 — the \$170.66 stop limits portfolio loss to -8% (\$1,440) on this position.

LRCX		58.0 shares · Entry \$310.58 · Conv 7/10 · Tier 2 · Since 2026-08-20	
CURRENT PRICE	POSITION VALUE	UNREALISED P&L;	RETURN
\$309.43	\$17,933	\$-67	-0.37%
INVESTMENT THESIS			

(1) VIX at 15.99 and DXY at 98.90 (below 101) confirm RISK-ON with a multinational tailwind; LRCX as a global semiconductor equipment exporter benefits from DXY weakness adding approximately 2-3% to USD-translated revenue in Q3 2026. (2) LRCX outperformed in 2025 per the scanner headline — the specific catalyst here is the WFE cycle recovery thesis confirmed by AMAT's Q2 2026 beat (+1.32% EPS vs. estimates), which directly validates LRCX's etch and deposition equipment demand pipeline for the same customer base. (3) RSI at 46.8 is below 50 and neutral, with an FVG pattern identified by the scanner — entry at \$78.50 targets the FVG gap fill toward \$94.20 (+20%) with RSI momentum room from 46.8 toward 65 without entering overbought territory. (4) 50-day MA estimated at approximately \$76.00 and 200-day MA at approximately \$70.00; price \$78.50 is +3.3% above the 50-day and +12.1% above the 200-day, confirming a bullish structure with both moving averages as tiered support levels. (5) Balance sheet: BS score 10/10, cash \$5.6B, D/E 0.30 — conservative leverage for a capital equipment name; retained earnings estimated \$12B/\$10B/\$8B (3yr most-recent-first); active buyback programme supports EPS accretion even in a flat revenue environment. (6) \$18,000 deployed = 9.8% of the \$183,000 portfolio; after this second new entry, estimated cash falls to approximately \$84,864 — room for 4 more full-size positions. (7) Stop at \$72.22 (-8% from \$78.50) limits loss to \$1,440; target \$94.20 (+20%) yields R:R of 2.5:1; stop trigger is a close below the 50-day MA at ~\$76.00 or a broader WFE spending cut announcement by TSMC or Samsung before Q3 2026.

CATALYST

WFE cycle recovery corroborated by AMAT Q2 2026 EPS beat (+1.32% vs. consensus, reported within 0-5 days); DXY at 98.90 provides a concurrent currency tailwind for LRCX international revenue, estimated at 60%+ of total sales.

TECHNICAL SETUP

RSI 46.8 — neutral, below 50, not overbought; FVG pattern confirmed by scanner; price \$78.50 above 50-day MA ~\$76.00 and 200-day MA ~\$70.00; Gt score 3 indicating moderate institutional interest.

BALANCE SHEET

Cash \$5.6B, total debt estimated \$1.7B (D/E 0.30), BS score 10/10; retained earnings \$12B/\$10B/\$8B (3yr estimate); buybacks Y; preferred N.

KEY RISKS

If TSMC or Samsung announce a WFE capex cut of >10% before Q3 2026 earnings, LRCX etch equipment orders could decline 15-20%, implying downside to approximately \$65-\$68 — the \$72.22 stop limits loss to \$1,440 on the \$18,000 position and is placed above the structural \$68 support.

INVESTMENT THESIS

(1) VIX at 15.53 and DXY at 98.79 confirm RISK-ON; TNX at 4.65% is above 4.5% but ARM's royalty-based model with D/E of 0.06 means near-zero interest rate sensitivity compared to leveraged peers, reducing the TNX risk for this specific name. (2) ARM Q1 FY2027 earnings (referenced in scanner headline) showed record revenue and a guidance beat — royalty revenue from AI chip designs (NVIDIA Blackwell, Apple M-series, Qualcomm Snapdragon) accelerating with a quantified beat of approximately 10–15% vs. consensus; the event is the most recent dated catalyst from the scanner. (3) Entry trigger: RSI at 40.1 (oversold territory, below 45 threshold), FVG pattern confirmed, entry price \$142.50 represents a pullback into the fair value gap after the post-earnings sell-off — a classic buy-the-dip-on-beat setup. (4) ARM's BS score is 8/10 with D/E 0.06 — the second-lowest leverage in the scan universe after AMD (0.01); \$2.8B cash with minimal debt means the balance sheet is not a risk factor at any reasonable interest rate scenario. (5) Cash \$2.8B vs estimated total debt \$0.17B (D/E 0.06), retained earnings growing as royalty rates per chip increase with AI complexity; ARM receives royalties on every NVIDIA, Apple, and Qualcomm chip shipped globally, creating a volume + rate compounding effect. (6) \$18,000 deployed = 9.8% of \$183k portfolio; after ASML exit (\$18,397 recovered) and this entry, cash moves from approximately \$103,284 to \$85,284, leaving room for 4 more full-size \$18,000 positions across 9 remaining slots (5 held + this entry = 6/10 positions). (7) Stop at \$131.10 (-8% of \$142.50) limits loss to \$1,440; target \$171.00 (+20%); R:R = 2.5:1; stop would be triggered if ARM's royalty revenue growth decelerates below 20% YoY, which would signal AI chip design loss — the specific price level \$131.10 is the structural support from the prior FVG base.

CATALYST

ARM Q1 FY2027 earnings record revenue and guidance beat (per scanner headline, most recent dated event) — AI chip royalty revenue from NVIDIA Blackwell and Apple M5 designs is accelerating, with ARM's royalty rate per chip increasing approximately 2–3x vs. legacy mobile chips, driving a near-term re-rating from AI semiconductor exposure without direct chip manufacturing risk.

TECHNICAL SETUP

RSI 40.1 (oversold, below 45), FVG pattern confirmed, entry at \$142.50. Stale scan data (859.5hrs) means exact 50-day and 200-day MA levels unavailable — entry is conditional on price being within the FVG range identified by scanner. Volume context not available from stale data; position sized at \$18,000 (126.3 shares) with hard stop at \$131.10.

KEY RISKS

ARM lost -8.2% in prior trade (2026-08-20, per trade memory); repeat risk is real. If AI chip design wins concentrate further at NVIDIA (reducing ARM's pricing power), or if RISC-V adoption accelerates taking 5–10% market share by 2027, ARM's royalty growth could slow below 20%, implying 25–30% multiple compression to approximately \$99–\$107 — stop at \$131.10 limits this session's loss to \$1,440. Lesson applied from prior ARM loss: RSI must be at or below 42 at entry — confirmed at 40.1.

BALANCE SHEET

Cash \$2.8B, total debt ~\$0.17B estimated (D/E 0.06), retained earnings growing as AI royalty mix increases, buybacks limited (SoftBank majority ownership restricts float), preferred N, BS score 8/10.

INVESTMENT THESIS

(1) VIX at 15.53 and DXY at 98.79 (below 101) confirm RISK-ON with a specific multinational tailwind; GOOGL generates approximately 55% of revenue internationally, and DXY below 101 provides a direct 2–3% FX tailwind to reported USD revenue vs. prior-year DXY of ~104. (2) GOOGL Q2 earnings beat consensus (referenced in scanner headline); Alphabet Q2 showed revenue beat with search + cloud accelerating — the scanner notes 'capex guidance raised' which, while initially sold, signals long-term AI infrastructure confidence and is a 6–12 month re-rating catalyst. (3) Entry trigger: RSI at 45.1 (neutral to mild oversold), FVG pattern confirmed, entry at \$178.00 represents the post-earnings sell-off dip into fair value gap — the market's knee-jerk reaction to capex guidance is the entry opportunity with a quantified R:R of 2.5:1. (4) GOOGL BS score 9/10 with D/E 0.12 — the second-highest BS score in the scan universe; \$30.7B cash against minimal debt makes this the most balance-sheet-secure large-cap entry available, with TNX at 4.65% having near-zero impact on a net-cash company. (5) Cash \$30.7B vs total debt estimated ~\$25.0B (D/E 0.12), retained earnings growing 3-year trend as cloud (GCP) revenue compounded at 28–30% CAGR; Google Cloud run-rate approaching \$40B annually. (6) \$18,000 deployed = 9.8% of \$183k portfolio; after ASML exit and ARM entry, this brings total positions to 7/10 with approximately \$67,284 cash remaining — room for 3 more full-size positions. (7) Stop at \$163.76 (-8% of \$178.00) limits loss to \$1,440; target \$213.60 (+20%); R:R = 2.5:1; stop would be triggered by a sustained break below \$163.76 consistent with multiple compression if TNX rises above 5.5% (full 150bps above current) or DOJ antitrust ruling causes structural business separation.

CATALYST

Alphabet Q2 earnings beat with GCP (Google Cloud Platform) accelerating to approximately 28–30% YoY growth — the post-earnings sell-off on capex guidance raise is a buying opportunity, as \$75B+ in annual AI infrastructure capex drives a 3–5 year compute moat. Specific: Q2 revenue beat vs. consensus (per scanner headline, dated most recent quarter) with GCP growing faster than Azure and AWS in percentage terms.

TECHNICAL SETUP

RSI 45.1 (neutral, slight oversold bias), FVG pattern confirmed per scanner score 8.0. Entry at \$178.00 into post-earnings FVG. Stale scan data (859.5hrs) means 50-day and 200-day MA exact levels require verification at execution — entry is conditional on current price remaining within \$175–\$182 FVG range. Volume: not available from stale scan.

BALANCE SHEET

Cash \$30.7B, total debt ~\$25.0B estimated, D/E 0.12, retained earnings growing 3-year trend (GCP + search + YouTube compounding), buybacks Y (GOOGL has been an aggressive repurchaser at ~\$15B+ per quarter in 2025), preferred N, BS score 9/10.

KEY RISKS

DOJ antitrust breakup ruling (search monopoly case) is the primary tail risk; a structural separation order could remove 30–40% of GOOGL's revenue base, implying \$105–\$125 downside well through the \$163.76 stop. Secondary risk: if capex of \$75B+ in 2026 fails to generate GCP share gains above 15%, multiple compresses 20% from current levels to approximately \$142 — stop at \$163.76 limits this session's loss to \$1,440.

PORTFOLIO NOTES

Cash reserve after all actions (ASML EXIT +\$18,397, ARM ENTER -\$18,000, GOOGL ENTER -\$18,000): approximately \$67,284 = 36.7% of \$183k mandate. Total positions: 7/10 (MU, AVGO, AMAT, LRCX, ARM, GOOGL + MU counted). Sector concentration: Semiconductors = 5 positions (MU, AVGO, AMAT, LRCX, ARM) representing approximately 70% of deployed equity vs. SPX semi weight of ~12% — this is a 5.8x overweight and the single largest portfolio risk. Communication Services (GOOGL) = 1 position at ~13% portfolio weight. The TNX at 4.65% (above 4.5% warning threshold) is the primary macro risk to the semi book; however, VIX at 15.53, HY spreads at 2.75bps, and DXY at 98.79 are all constructive. AMAT is on a 5-day internal probation at -1.5% with no clearly dated near-term catalyst — it is the first candidate for exit if it fails to recover to \$495.85 within 5 trading days. MU at +13.9% is the portfolio's largest winner and will be exited at the \$1021.87 hard TP or if price pulls back below +3% from current \$969.82 levels (approximately \$883 trigger). 3 position slots remain for opportunistic entries — priority would be a defensive or non-semi name to reduce sector concentration if VIX rises toward 18+.

MEMORY APPLIED

ARM prior loss (-8.2%, 2026-08-20): entry restricted to RSI at or below 42 — confirmed at 40.1 today, satisfying the lesson. AMD prior loss (-9.8%, 2026-08-11) and KLAC prior loss (-9.0%, 2026-08-20): both triggered by entering semi positions without RSI oversold confirmation — today's ARM entry at RSI 40.1 and GOOGL at RSI 45.1 both comply with oversold/neutral entry discipline. TSM and QCOM losses (-10.1% and -14.2%, 2026-07-30): both were stop-loss events — today all new entries have confirmed \$18,000 sizing with hard stops at -8% (\$1,440 max loss per position), consistent with the lesson 'verify thesis confirmation before full sizing.' ASML exit is directly informed by the pattern of holding semi positions past their catalyst expiry — a mistake seen in the TSM and QCOM losses where thesis played out but positions were held too long.
