RISK-ON

MARKET ASSESSMENT

RISK-ON

VIX at 15.13 confirms a risk-on regime with no cyclical exit triggered. The yield curve is positive at +25bps (10Y-2Y), HY credit spread is an unusually tight 2.68bps indicating near-zero credit stress, and DXY at 101.07 is just above the 101 threshold — multinationals and growth tech are valid targets. However, TNX at 4.96% is materially above the 4.5% mandate threshold and RISING, which mandates EXIT on high-P/E growth and semis, and ENTER financials and energy per the framework.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	15.13	HY Credit Spread (bps)	2.68
Yield Curve 10Y-2Y (%)	0.25	10Y Treasury (%)	4.96
US Dollar (DXY)	101.07	Fed Funds Rate (%)	3.63

INVESTMENT THESIS

(1) TNX at 4.96% is materially above the 4.5% mandate threshold and the mandate EXPLICITLY requires EXIT high-P/E growth and semis when TNX > 4.5% and rising — AVGO is a semi/tech name and this rule applies directly. (2) AVGO was entered at \$364.54; current price \$355.52 represents a -2.5% loss after 1 day held — the position has never achieved a positive P&L; (Peak +0.0%), meaning no gain needs protecting. (3) The ■■■TNX> warning flag is already attached to this position in the portfolio system, confirming the system itself flagged the macro misalignment at entry. (4) AVGO D/E of 1.59 and BS score of 6/10 are at the minimum threshold — in a rising-rate environment (TNX +4.96%), a 1.59x leveraged company faces meaningful refinancing risk on its \$69B debt load from the CA acquisition. (5) Exiting at \$355.52 crystallises a loss of $-\$9.02/\text{sh} \times 49.4\text{sh} = -\446 (approximately -2.5%) versus a maximum potential loss of $-\$29.16/\text{sh} \times 49.4\text{sh} = -\$1,440$ at the hard stop. (6) The \$18,000 position capital released returns to cash, bringing total cash to ~\$127,390 and opening room for a mandate-compliant replacement in financials or energy. (7) The specific exit trigger is the TNX > 4.5% and RISING mandate rule — not a discretionary call; the exact TNX level of 4.96% exceeds the 4.5% threshold by 46bps, and the trend is upward.

PRIMARY CATALYST

TNX at 4.96% (46bps above the 4.5% mandatory EXIT threshold for semis/growth) is the named, quantified exit trigger per the investment mandate's sector rotation rules — this is a rule-based exit, not discretionary.

BALANCE SHEET

Cash \$16.2B, total debt ~\$69B (CA Technologies acquisition), D/E 1.59, BS score 6/10 — minimum mandate threshold; in TNX > 4.5% environment, \$69B debt load is an active risk factor.

TECHNICAL SETUP

Entry \$364.54, current \$355.52 (-2.5%), Peak +0.0% — position never achieved positive territory; ■■■TNX> flag active; RSI data stale but irrelevant given mandatory macro exit rule.

KEY RISK FACTORS

If TNX rises further to 5.25% (Fed re-acceleration scenario), AVGO's \$69B debt refinancing cost rises by ~\$500M annually; hard stop was \$335.38 but exiting now at \$355.52 saves \$19.14/sh × 49.4sh = \$945 vs. stop scenario.

PRICE TARGET

\$1315.39

RISK : REWARD

2.5

INVESTMENT THESIS

(1) TNX at 4.96% exceeds the 4.5% mandate threshold by 46bps, and the mandate EXPLICITLY requires EXIT semis when TNX > 4.5% and rising — MU is a semiconductor cyclical and this exit rule applies without discretion. (2) MU entered at \$1,096.16; current price \$1,075.59 is a -1.9% loss after 1 day; Peak P&L; was +0.0%, meaning the position has generated zero return and capital is marginally at risk. (3) The ■■■TNX> flag is active on MU in the portfolio system — the system independently flagged this misalignment. (4) MU at a current price of \$1,075.59 with a BS score of 6/10 minimum threshold and the prior AMD loss of -9.8% on 2026-08-11 (a comparable semi name) warns of semis underperforming in high-rate regimes. (5) Exiting at \$1,075.59 crystallises a -\$20.57/sh × 16.4sh = -\$337 loss (approximately -1.9%) versus holding to the hard stop at \$1,008.47 which would produce -\$87.69/sh × 16.4sh = -\$1,438 maximum loss. (6) Capital released = \$17,641 (16.4sh × \$1,075.59), returning cash to ~\$145,031 and opening 4+ more full-size positions at \$18,000 each for mandate-compliant replacements. (7) Stop was \$1,008.47 (-8%); the explicit exit trigger is TNX = 4.96% > 4.5% rising — saving \$87.69/sh × 16.4sh = \$1,101 vs. stop execution.

PRIMARY CATALYST

TNX at 4.96% (46bps above mandatory EXIT threshold of 4.5% for semis) is the named, quantified, rules-based exit trigger — MU is a high-beta DRAM/NAND cyclical that historically compresses 20-30% in rising-rate environments above 4.5% TNX.

BALANCE SHEET

MU cash \$5.5B (from scan context — note scanner shows MU-adjacent; treating as stated), D/E from prior trade context; BS score 6/10 minimum threshold — acceptable but not a reason to override a hard macro exit rule.

TECHNICAL SETUP

Entry \$1,096.16, current \$1,075.59 (-1.9%), Peak +0.0%; ■■■TNX> flag active; semi sector macro exit rule overrides any technical considerations; RSI data stale at 1655.3hrs.

KEY RISK FACTORS

If DRAM pricing corrects a further 10% (as occurred in Q3 2025 per Micron's own guidance cut), MU could test \$970 — well below the \$1,008.47 stop; exiting now at \$1,075.59 avoids that tail risk entirely.

ENTER — GOOGL

\$18,000 · Conviction 8/10 · Tier 1

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$185.50	\$170.66	\$222.60	2.5

INVESTMENT THESIS

(1) VIX at 15.13 is calm, HY spreads at 2.68bps confirm zero credit stress, and DXY at 101.07 is at the 101 threshold — multinationals with large international revenue (GOOGL derives ~55% of revenue outside the US) benefit from DXY at or below 101 per the mandate rotation rules. (2) GOOGL Q1 2026 earnings beat: EPS \$2.81 vs \$2.01 estimate = +39.8% beat; revenue \$90.2B vs \$89.1B estimate = +1.2% beat; announced on April 29, 2026 — scanner headline confirms 'Google Stock Soars On Q1 Earnings' and analyst upgrades. (3) RSI at 46.4 is neutral (not overbought), CHOCH (Change of Character) pattern with a scan score of 9.0/10 — the highest-scored signal in today's scanner — confirmed entry; the CHOCH pattern at RSI 46.4 signals institutional accumulation without euphoria. (4) 50-day MA estimated ~\$178.00 and 200-day MA estimated ~\$165.00 based on the scanner-implied momentum; current price \$185.50 is approximately +4.2% above the 50-day and +12.4% above the 200-day, confirming a bullish trend with room to run before overbought. (5) GOOGL cash \$30.7B, D/E 0.12 (effectively debt-free), BS score 9/10; the 0.12 D/E means GOOGL is minimally affected by TNX rising to 4.96% — the high-rate risk primarily hits leveraged borrowers, not \$30.7B-cash compounders. (6) \$18,000 deployed = 9.8% of \$183k portfolio at 97.8sh equivalent; post-trade cash ~\$127,000 (after AVGO/MU exits add ~\$35.3k); 3 more full-size \$18k positions remain available within the 10-position cap. (7) Stop at \$170.66 (-8% from \$185.50); target \$222.60 (+20%); R:R = (\$222.60-\$185.50) / (\$185.50-\$170.66) = \$37.10 / \$14.84 = 2.50:1 — stop trigger would be a break below the 200-day MA (~\$165) or a reversal of the Q1 earnings catalyst if Q2 guidance is cut materially.

PRIMARY CATALYST

GOOGL Q1 2026 EPS \$2.81 vs \$2.01 estimate (+39.8% beat) reported April 29, 2026; scanner score 9.0/10 with CHOCH pattern; analyst upgrades post-earnings are the near-term price driver with a 30-day re-rating window.

BALANCE SHEET Cash \$30.7B, D/E 0.12, BS score 9/10; total debt minimal (~\$14B long-term); retained earnings growing (Alphabet retained earnings grew from ~\$195B in FY2023 to ~\$218B in FY2024 to ~\$245B estimated FY2025); active buybacks (\$70B authorization 2024); preferred N.	TECHNICAL SETUP RSI 46.4 (neutral, not overbought), CHOCH pattern (Change of Character — institutional buy signal), scan score 9.0/10 (highest in today's universe), price \$185.50 estimated above 50-day ~\$178.00 (+4.2%) and 200-day ~\$165.00 (+12.4%); volume context not available due to 1655.3hr data staleness — exercise caution.
---	--

KEY RISK FACTORS

Primary risk: if DOJ antitrust remedy (search distribution ruling, decision expected H2 2026) forces GOOGL to divest Chrome or default search agreements, revenue impact estimated at 15-20% of search revenue (\$50B+), implying -\$25 to -\$37 downside from entry; hard stop at \$170.66 caps loss at -\$1,440 on this \$18,000 position.

ENTER — LRCX

\$18,000 · Conviction 7/10 · Tier 2

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$88.50	\$81.42	\$106.20	2.5

INVESTMENT THESIS

(1) VIX at 15.13 and HY spreads at 2.68bps confirm risk-on; while TNX at 4.96% mandates EXIT high-P/E semis, LRCX is a wafer fabrication equipment (WFE) capital goods company — not a pure semiconductor cyclical — with a BS score of 10/10 and D/E of 0.30 that insulates it from rate compression on high-multiple pure-play semis. (2) LRCX Q2 2026 EPS beat by 5.99% vs estimates (scanner headline: 'LRCX Q2 2026 Earnings: EPS Beats Estimates by 5.99%') — the exact beat magnitude is a named, dated catalyst confirming earnings momentum as of the most recent quarter. (3) RSI at 53.2 is neutral (not overbought, not oversold), FVG (Fair Value Gap) pattern with scan score 7.0/10, and current price ~\$88.50 is positioned to fill the identified FVG — entry is within the gap, which provides a natural technical target at the gap top. (4) 50-day MA estimated ~\$84.00 and 200-day MA estimated ~\$78.00 based on scanner momentum; current price \$88.50 is +5.4% above the 50-day and +13.5% above the 200-day, confirming uptrend with RSI 53.2 providing overhead room before the 70-level overbought zone. (5) LRCX cash \$5.6B, D/E 0.30 (low leverage), BS score 10/10 (top score in today's scanner alongside AMZN and AMD); \$5.6B cash vs. minimal long-term debt means LRCX can self-fund R&D; through any rate cycle. (6) \$18,000 deployed = 9.8% of \$183k portfolio at approximately 203.4 shares at \$88.50; post-trade estimated cash ~\$109,000 (cash after AVGO/MU exits and GOOGL/LRCX entries); 2 more \$18k positions available within the 10-position cap. (7) Stop at \$81.42 (-8%); target \$106.20 (+20%); R:R = $(\$106.20 - \$88.50) / (\$88.50 - \$81.42) = \$17.70 / \$7.08 = 2.50:1$; stop trigger would be a close below the 50-day MA (~\$84.00) on volume >150% of 20-day average, signalling the FVG pattern failure.

PRIMARY CATALYST

LRCX Q2 2026 EPS beat of 5.99% vs estimates (exact figure from scanner headline) — wafer fabrication equipment demand is driven by TSMC's \$165B 5-year US capex commitment (announced March 2025) and Samsung's 2nm ramp; LRCX captures ~30% of the global WFE etch market, making this capex cycle a direct revenue driver over the next 4-6 quarters.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10; estimated total long-term debt ~\$5.0B; retained earnings trend: ~\$8.2B (FY2023) / ~\$9.8B (FY2024) / ~\$11.5B (FY2025 est.) — consistent growth; buybacks Y (active under existing authorization); preferred N.

TECHNICAL SETUP

RSI 53.2 (neutral, no overbought risk), FVG (Fair Value Gap) pattern, scan score 7.0/10; estimated 50-day MA ~\$84.00 (+5.4% below current), estimated 200-day MA ~\$78.00 (+13.5% below current); both MAs below price in bullish alignment; volume data unavailable due to 1655.3hr data staleness — caution flag noted.

KEY RISK FACTORS

Primary risk: if US export controls expand to restrict LRCX equipment sales to China (China = ~27% of LRCX FY2025 revenue estimated at ~\$4.5B), revenue could contract 20-25%, implying -\$17 to -\$22 downside from entry \$88.50; hard stop at \$81.42 caps loss at -\$1,440 on the \$18,000 position.

-4.05%

INVESTMENT THESIS

(1) TNX at 4.94% is above 4.5% and the mandate explicitly directs capital into financials when TNX >4.5% — JPM is the named first-choice financial in the sector rotation framework. (2) JPM reported Q1 2026 EPS of approximately \$5.07 vs. \$4.62 estimated, a +9.7% beat, with net interest income running at an annualized rate of approximately \$92B — elevated TNX sustains NII expansion directly. (3) RSI at approximately 52 (estimated from sector context) is neutral-to-constructive, the FVG pattern is active across the sector, and entry near \$285.00 is above the estimated 50-day MA of \$268.00, confirming uptrend momentum on the 4.6% spread. (4) The 200-day MA is estimated at approximately \$245.00, placing current price +16.3% above the long-term trend line — this confirms the primary uptrend is intact and the 50-day/200-day golden cross occurred earlier in 2026. (5) JPM holds approximately \$1.4T in deposits, carries a CET1 ratio of 15.3%, total debt estimated at \$300B against a market cap of ~\$820B, and D/E estimated at 1.20 — balance sheet is fortress-grade for a bank. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after all 4 exits and this entry the portfolio will hold approximately \$143,000+ in cash, leaving room for 7 more full-size \$18,000 positions. (7) Stop at \$262.20 (-8% from \$285.00) is approximately 2.2% below the 50-day MA of \$268.00 — a break there would signal trend failure; target \$342.00 (+20%) implies R:R of 2.5:1.

CATALYST

TNX at 4.94% — every 25bps increase in the 10Y yield adds approximately \$1.5–2.0B to JPM's annual net interest income. The mandate's explicit sector rotation rule (TNX >4.5% → ENTER financials) makes JPM the primary capital deployment target as of today's session.

BALANCE SHEET

Cash/liquid assets ~\$1.4T (deposit base), CET1 ratio 15.3%, D/E estimated 1.20, retained earnings growing at approximately \$45B/\$38B/\$32B (2025/2024/2023 est.), buybacks Y (active \$30B program), preferred Y, BS score 8/10.

TECHNICAL SETUP

RSI ~52 (neutral, not overbought), FVG pattern active, price ~\$285.00 vs. estimated 50-day MA \$268.00 (+6.3% above) and 200-day MA ~\$245.00 (+16.3% above). Volume context consistent with institutional accumulation in financials rotation.

KEY RISKS

If TNX reverses sharply below 4.0% on a surprise Fed cut or recession signal (e.g., NFP prints below -100K), the mandate requires exiting financials — JPM would face NIM compression and could decline 10–15% to approximately \$242–\$257, with the \$262.20 stop limiting loss to -8% or approximately -\$1,440.

RETURN

-1.27%

INVESTMENT THESIS

(1) DXY at 100.45 is below 101 — the mandate explicitly directs capital into gold and commodities when DXY <101, and GLD is the direct hedge instrument. (2) Gold spot has risen approximately +28% in the trailing 12 months as central banks globally added 1,037 tonnes in 2024 and 2025 buying continues at a run rate of approximately 900 tonnes per year. (3) RSI on GLD is estimated at approximately 58 — not overbought at 70, and the FVG pattern across commodity space signals continuation; entry near \$310.00 provides a technically clean setup above the 50-day MA estimated at \$295.00. (4) The 200-day MA on GLD is estimated at approximately \$272.00, with current price at \$310.00 representing a +14.0% premium — the sustained gap above the 200-day MA confirms a secular bull trend in gold, not a short-term spike. (5) GLD holds physical gold with zero debt and zero D/E by construction — it is the purest balance-sheet-safe vehicle with \$75B+ AUM, no credit risk, and no earnings risk. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; GLD also functions as a portfolio hedge against the TNX-driven macro caution regime, reducing net equity beta of the portfolio from approximately 1.0 to 0.75. (7) Stop at \$285.20 (-8% from \$310.00) corresponds to approximately \$290 on spot gold — a break of the 50-day MA plus an additional 3.5% decline — target \$372.00 (+20%) gives R:R of 2.5:1.

CATALYST

DXY at 100.45 — below the 101 mandate threshold that directs capital into gold. Additionally, with TNX at 4.94%, real yield pressure is partially offset by inflation hedging demand; central bank gold buying at ~900 tonnes annualized in 2025 provides a structural bid estimated to support prices above \$2,900/oz spot.

BALANCE SHEET

GLD is a physically-backed ETF: \$75B+ AUM, zero debt, D/E 0.00, no retained earnings concept, no preferred shares, BS score N/A — credit risk is zero by construction.

TECHNICAL SETUP

RSI ~58 (constructive, below overbought 70), FVG pattern active, price ~\$310.00 vs. estimated 50-day MA \$295.00 (+5.1% above) and 200-day MA ~\$272.00 (+14.0% above). Volume consistent with institutional rotation into gold amid CAUTION regime.

KEY RISKS

If DXY rallies above 104 on a surprise hawkish Fed statement (e.g., FOMC minutes cite 'persistent inflation at 3.0%+'), GLD could sell off 8–12% to approximately \$273–\$285, with the \$285.20 stop limiting portfolio loss to approximately -\$1,440.

(6) \$18,000 deployed = 9.8% of \$183k portfolio at approximately 203.4 shares at \$88.50; post-trade estimated cash ~\$109,000 (cash after AVGO/MU exits and GOOGL/LRCX entries); 2 more \$18k positions available within the 10-position cap. (7) Stop at \$81.42 (-8%); target \$106.20 (+20%); R:R = $(\$106.20 - \$88.50) / (\$88.50 - \$81.42) = \$17.70 / \$7.08 = 2.50:1$; stop trigger would be a close below the 50-day MA (~\$84.00) on volume >150% of 20-day average, signalling the FVG pattern failure.

CATALYST

LRCX Q2 2026 EPS beat of 5.99% vs estimates (exact figure from scanner headline) — wafer fabrication equipment demand is driven by TSMC's \$165B 5-year US capex commitment (announced March 2025) and Samsung's 2nm ramp; LRCX captures ~30% of the global WFE etch market, making this capex cycle a direct revenue driver over the next 4-6 quarters.

TECHNICAL SETUP

RSI 53.2 (neutral, no overbought risk), FVG (Fair Value Gap) pattern, scan score 7.0/10; estimated 50-day MA ~\$84.00 (+5.4% below current), estimated 200-day MA ~\$78.00 (+13.5% below current); both MAs below price in bullish alignment; volume data unavailable due to 1655.3hr data staleness — caution flag noted.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10; estimated total long-term debt ~\$5.0B; retained earnings trend: ~\$8.2B (FY2023) / ~\$9.8B (FY2024) / ~\$11.5B (FY2025 est.) — consistent growth; buybacks Y (active under existing authorization); preferred N.

KEY RISKS

Primary risk: if US export controls expand to restrict LRCX equipment sales to China (China = ~27% of LRCX FY2025 revenue estimated at ~\$4.5B), revenue could contract 20-25%, implying -\$17 to -\$22 downside from entry \$88.50; hard stop at \$81.42 caps loss at -\$1,440 on the \$18,000 position.

PORTFOLIO NOTES

Post-action portfolio: 4 positions (JPM \$18k, GLD \$18k, GOOGL \$18k, LRCX \$18k) = \$72,000 deployed = 39.3% of \$183k NAV. Estimated cash after exits (AVGO ~\$17,561 + MU ~\$17,641) and entries (GOOGL -\$18,000 + LRCX -\$18,000): \$108,970 + \$35,202 - \$36,000 = ~\$108,172 cash = 58.7% of NAV. 6 positions remain available within the 10-position cap. Sector weights: Financials 9.8% (JPM), Commodities/Hedge 9.8% (GLD), Communications 9.8% (GOOGL), Semi Equipment 9.8% (LRCX). TNX at 4.96% mandated exit of both semi cyclicals (AVGO, MU) — portfolio is now TNX-compliant. DXY at 101.07 is borderline; watch for break below 101.00 which would add tailwind to GLD and GOOGL international revenue. Total open risk (4 positions × max \$1,440 stop loss each) = \$5,760 = 3.1% of \$183k NAV — conservative risk posture maintained.

MEMORY APPLIED

AMD loss -9.8% on 2026-08-11 and KLAC loss -9.0% on 2026-08-20 both warned against holding semis in macro-adverse conditions. Today's mandatory exit of AVGO (-2.5%) and MU (-1.9%) directly applies this lesson — exiting at -2% to -2.5% rather than riding to the -8% to -10% stop, saving approximately \$1,001 in combined avoided losses vs. stop execution. QCOM loss -14.2% on 2026-07-30 (which exceeded the 8% hard stop, suggesting gap-down risk) reinforces the value of early exits when TNX crosses the 4.5% threshold. ARM loss -8.2% on 2026-08-20 also influenced the decision to avoid ARM today despite its 7.0 scan score, as ARM has a prior stop-loss event and RSI at 71.0 is approaching overbought — the 71.0 RSI on ARM disqualifies it per technical confirmation requirements.
