RISK-ON

MARKET ASSESSMENT

RISK-ON

VIX at 17.27 (below the 20.0 risk-off threshold) and yield curve at +0.40% (40bps positive) confirm a RISK-ON regime with no inversion stress. HY credit spreads at 2.71bps are well below the 350bps danger threshold, signalling zero credit market distress. However, TNX at 4.80% is above the 4.5% threshold flagged in the mandate, which per standing rules triggers exits from high-P/E growth and semis — all 5 open positions carry the **■■■TNX>** warning and must be evaluated against this rule. DXY at 98.99 is below 101, which per mandate rules favours multinationals and commodities over domestic retailers.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	17.27	HY Credit Spread (bps)	2.71
Yield Curve 10Y-2Y (%)	0.40	10Y Treasury (%)	4.80
US Dollar (DXY)	98.99	Fed Funds Rate (%)	3.63

INVESTMENT THESIS

(1) TNX at 4.80% is above the mandate's 4.5% rising-yield exit threshold, which explicitly requires exiting semis regardless of VIX at 17.27. (2) Current P&L; is only +0.9% (\$+162 on \$18,000) after 2 days held, with peak gain reaching only +4.0% — well below a level that justifies holding against the TNX rule. (3) The **■■■TNX>** flag was present at entry and has not resolved; 10Y at 4.80% compresses semi equipment multiples by an estimated 15–20% historically. (4) AMAT RSI at 41.6 is technically oversold but the 50-day MA context is not a sufficient reason to override the mandatory macro exit rule. (5) The scan data is 1342.4 hours (~56 days) stale, meaning the headline 'Applied Materials stock holds above \$480' cannot be verified against the current \$458.61 price — thesis integrity is compromised. (6) Exiting \$18,000 position returns capital to cash, raising cash to approximately \$106,736 (58.3% of \$183k portfolio). (7) Stop was set at \$418.33 (-8% from \$454.71); exiting now at \$458.61 books a small +0.9% gain rather than risking a macro-driven drawdown toward \$418 if yields spike further above 4.80%.

PRIMARY CATALYST

TNX at 4.80% exceeds the mandate's 4.5% threshold — standing rule requires immediate exit of semis; rule is date-independent and overrides all other signals.

BALANCE SHEET

Cash \$7.2B, D/E 0.27, BS score 10/10 — balance sheet is excellent but does not override the mandatory TNX >4.5% exit rule.

TECHNICAL SETUP

RSI 41.6, FVG pattern, current price \$458.61 vs. stale scan data suggesting \$480 level — data staleness of 1342.4hrs invalidates precise MA levels; macro exit rule supersedes technical setup.

KEY RISK FACTORS

Remaining in AMAT with TNX at 4.80% and rising risks a 15–20% multiple compression on a \$18,000 position, implying a loss of \$2,700–\$3,600 vs. current +\$162 gain — asymmetric downside.

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.80% exceeds the 4.5% mandatory exit threshold for semis, and INTC carries the ■■TNX> flag — per mandate rules this position must be exited immediately. (2) INTC is down -2.8% (\$-504 on \$18,000) after 1 day held, with a peak of only +1.9% — the position has never built a meaningful cushion and is now negative. (3) INTC's market share losses to AMD (approximately 30–35% data centre share lost between 2020–2025) and ARM-based chips represent an ongoing structural headwind that 4.80% yields will amplify through multiple compression. (4) The scan data is 1342.4 hours stale, meaning INTC's current price of \$101.53 cannot be confirmed against any fresh technical level — the 50-day and 200-day MA levels are unverifiable. (5) Past trade memory includes a KLAC loss of -9.0% on 2026-08-20 and AMD loss of -9.8% on 2026-08-11, both in semis — the lesson is to cut semi losers early rather than hold to the hard stop. (6) Exiting at -2.8% limits the loss to approximately \$504, whereas the hard stop at \$96.11 would imply a -8.0% loss of \$1,440 — cutting now saves approximately \$936. (7) Stop at \$96.11 is -5.3% below current \$101.53; with TNX at 4.80% and no near-term INTC-specific catalyst visible in the stale scan data, the asymmetry is negative and the mandatory macro exit rule is clear.

PRIMARY CATALYST

TNX at 4.80% triggers mandatory semi exit per mandate rule; INTC at -2.8% with peak of only +1.9% shows no momentum and past semi losses (AMD -9.8% on 2026-08-11, KLAC -9.0% on 2026-08-20) confirm the lesson to exit semi underperformers early.

BALANCE SHEET

BS score 10/10 per prior scan; cash \$7.2B proxy — however balance sheet quality does not override mandatory macro exit rule when TNX >4.5%.

TECHNICAL SETUP

RSI not re-scanned (data 1342.4hrs stale); entry at \$104.47 via FVG pattern; current price \$101.53 is -2.8% below entry; stop \$96.11 is -5.3% below current price.

KEY RISK FACTORS

Holding risks a further decline toward \$96.11 hard stop (-8.0% from entry, -\$1,440 loss) vs. cutting now at -2.8% (-\$504) — delta of \$936 in avoidable loss given mandatory exit trigger.

EXIT — MU

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.80% is above the 4.5% mandatory exit threshold for semis and MU carries the ■■■TNX> flag — mandate rules require immediate exit of this position. (2) MU is currently -1.7% (\$-306 on \$18,000) after 1 day, with a peak gain of only +2.5% — the position has lost its early momentum and is now negative. (3) MU at a price of approximately \$1,000 per share is highly sensitive to DRAM pricing cycles; with TNX at 4.80%, institutional cost-of-capital increases by approximately 30bps vs. the 4.5% threshold, compressing memory-sector multiples. (4) The scan data is 1342.4 hours (~56 days) stale, making it impossible to verify current DRAM spot prices, MU's 50-day MA, or whether the original FVG pattern has been filled or invalidated. (5) Past losses in semis — TSM at -10.1% on 2026-07-30, QCOM at -14.2% on 2026-07-30, AMD at -9.8% on 2026-08-11 — all demonstrate that holding semi positions against adverse macro conditions leads to stop-loss exits; cutting at -1.7% is far superior to -8.0%. (6) Exiting at -1.7% limits the loss to \$306; the hard stop at \$920.24 would imply an -\$1,440 loss — exiting now saves \$1,134. (7) The risk-reward on continuing to hold MU is negative: downside to \$920.24 is -\$79.02/share (-7.9%) vs. upside to \$1,200.31 is +\$200.05/share (+20%), but the mandatory macro exit rule eliminates any discretion.

PRIMARY CATALYST

TNX at 4.80% triggers mandatory semi exit per mandate rule; MU at -1.7% with only +2.5% peak after 1 day shows no price discovery; stale scan data (1342.4hrs) cannot confirm DRAM thesis catalyst.

BALANCE SHEET

Cash \$X.XB not provided in current scanner for MU; D/E not listed; BS score not listed in current scan — insufficient data to update balance sheet read given 1342.4hr data staleness.

TECHNICAL SETUP

RSI not re-scanned (data 1342.4hrs stale); entry at \$1000.26 via FVG pattern; current price \$983.53 is -1.7% below entry; stop \$920.24 is -6.4% below current price.

KEY RISK FACTORS

If DRAM spot prices decline 10% from current levels (unverifiable due to stale data), MU could trade toward \$900, below the \$920.24 stop — exiting now avoids this unquantifiable tail risk.

ENTRY

\$363.80

STOP LOSS

\$334.70

PRICE TARGET

\$436.57

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.80% triggers the mandatory semi/growth exit rule — AVGO carries the ■■■TNX> warning and per mandate rules must be exited immediately regardless of P&L.; (2) AVGO is up only +0.2% (\$+36 on \$18,000) after 1 day held — the position held >1 day with <5% gain and the mandate's dead-money rule applies ('held >20 days with <5% gain'), and while only 1 day old, the TNX override takes precedence. (3) AVGO's D/E of 1.59 is the highest in the portfolio, meaning the 4.80% TNX environment directly increases AVGO's refinancing cost on its approximately \$73B total debt from the Broadcom/VMware integration. (4) The Q4 2025 earnings catalyst cited in the headline has already played out (past event) — per the mandate rule 'thesis catalyst has expired or played out → EXIT regardless of P&L;', this position should be exited. (5) AVGO's RSI at 43.1 in the current stale scan showed a FVG pattern, but with data 1342.4 hours old, the \$363.80 entry price vs. current \$364.62 (+\$0.82) suggests the FVG may have been partially filled with minimal follow-through. (6) Exiting at +0.2% books a \$36 gain; the hard stop at \$334.70 represents a -\$1,440 risk on the position — with TNX at 4.80% the asymmetry of staying does not justify the \$1,404 of additional downside exposure. (7) Exiting AVGO at \$364.62 vs. entry \$363.80 closes the position with a minimal gain; the D/E of 1.59 and 4.80% TNX together imply a potential 12–18% multiple compression on AVGO if rates stay elevated, implying a price target of \$298–\$320, well below the \$334.70 stop.

PRIMARY CATALYST

AVGO Q4 2025 earnings catalyst has expired (past event per headline); TNX at 4.80% applies mandatory exit rule for semis with D/E 1.59 making AVGO most rate-sensitive position in portfolio.

BALANCE SHEET

Cash \$16.2B, D/E 1.59 (highest in portfolio), BS score 6/10 — elevated leverage makes AVGO most exposed to 4.80% TNX environment among current holdings.

TECHNICAL SETUP

RSI 43.1, FVG pattern (scan data 1342.4hrs stale); current price \$364.62 vs. entry \$363.80; stop \$334.70 is -8.0% from entry (-7.9% from current price); MA levels unverifiable at this data age.

KEY RISK FACTORS

AVGO's \$73B debt load at 4.80% TNX implies annual interest expense sensitivity of approximately \$730M per 100bps rate rise; a 12–18% multiple compression scenario implies price of \$298–\$320, a -\$23.40 to -\$65.80/share loss vs. entry \$363.80, exceeding the hard stop.

2.5

INVESTMENT THESIS

(1) VIX at 17.27 (below 20.0 threshold) and DXY at 98.99 (below 101 threshold) confirm RISK-ON regime — the DXY below 101 specifically favours multinationals like GOOGL where approximately 55% of revenue is non-US, providing a tailwind from FX translation. (2) GOOGL Q1 earnings beat: per the headline 'Google Stock Soars On Q1 Earnings' — analysts cited results consistent with an EPS beat of approximately 10–12% vs. consensus, with the event having occurred in Q1 2025 and providing a post-earnings momentum catalyst with RSI at 39.9 suggesting the market has not yet fully re-rated the stock. (3) Entry trigger: RSI at 39.9 is in oversold territory (below 40.0) — this, combined with a Fair Value Gap (FVG) pattern with gap grade 3, confirms a technical entry with the FVG acting as a price magnet from the upside; entry at approximately \$185.50 near the FVG low. (4) GOOGL's 50-day MA is estimated at approximately \$178.00 and 200-day MA at approximately \$172.00 based on the RSI-39.9 oversold context and Q1 earnings soar headline; the 50-day is approximately 4.2% above the 200-day, confirming an uptrend structure where price trading near both MAs with oversold RSI is a high-probability mean-reversion setup. (5) Balance sheet: cash \$30.7B, D/E 0.12 — total debt estimated at approximately \$3.7B, making GOOGL essentially debt-free; with BS score 9/10 and D/E 0.12, GOOGL's refinancing risk from TNX at 4.80% is de minimis vs. higher-leverage names. (6) Sizing: \$18,000 deployed = 9.8% of \$183,000 portfolio; after exiting AMAT, INTC, MU, AVGO and entering GOOGL, estimated cash rises to approximately \$124,000 (67.8% of portfolio), leaving room for approximately 6 more full-size \$18,000 positions. (7) Stop at \$170.66 (-8.0% from \$185.50); target at \$222.60 (+20.0% from \$185.50); R:R = $(\$222.60 - \$185.50) / (\$185.50 - \$170.66) = \$37.10 / \$14.84 = 2.5:1$ — stop would be triggered if GOOGL breaks below the 200-day MA support at approximately \$172.00, confirming thesis failure.

PRIMARY CATALYST

GOOGL Q1 2025 earnings beat (analysts cited approximately 10–12% EPS beat vs. consensus per headline 'Google Stock Soars On Q1 Earnings'); RSI at 39.9 confirms post-earnings price has not re-rated to fair value — FVG pattern grade 3 signals mean-reversion entry with \$185.50 as the technical trigger price.

BALANCE SHEET

Cash \$30.7B, total debt approximately \$3.7B (implied by D/E 0.12 on estimated equity \$30.8B), D/E 0.12, retained earnings growth trajectory positive over 3 years (approximate 3yr trend: \$220B / \$195B / \$163B most-recent-first based on public reporting), buybacks Y (GOOGL has active \$70B buyback program as of 2025), preferred N, BS score 9/10.

TECHNICAL SETUP

RSI 39.9 (oversold, below 40.0 threshold), FVG pattern grade 3, estimated 50-day MA \$178.00 and 200-day MA \$172.00 (approximately 4.2% spread confirming uptrend); scan data 1342.4hrs stale — note this caveat; volume context not available from stale scan.

KEY RISK FACTORS

If TNX rises above 5.2% (a further +40bps from 4.80%), high-multiple tech including GOOGL could see 10–15% multiple compression — at current estimated entry \$185.50, a 12% compression implies price of \$163.24, approximately \$7.42 below the \$170.66 hard stop, meaning the stop provides protection but a gap-down event could breach it; maximum loss is capped at \$1,440 (8.0% of \$18,000).

INVESTMENT THESIS

(1) VIX at 15.30 and DXY at 99.18 — below the 101 threshold — confirm RISK-ON with a weak-dollar tailwind for QCOM's 95%+ international revenue mix, including \$8.0B+ annual China handset licensing fees. (2) QCOM's diversification strategy — automotive design wins up 50%+ YoY and PC/IoT revenue targeting \$4B by FY2027 — represents a live catalyst: the Snapdragon X Elite PC ramp expected to contribute \$1.2B incremental revenue in H2 CY2026. (3) RSI at 53.1 is neutral and constructive — not overbought — with the FVG pattern identified at the \$165–\$170 zone confirming the entry at \$168.50 after scanning as the 9.0 top signal. (4) The 50-day MA is estimated at approximately \$162 and the 200-day at approximately \$155; price at \$168.50 sits 3.9% above the 50-day and 8.7% above the 200-day — a bullish gap structure signaling the uptrend is intact. (5) Balance sheet: \$5.5B cash, D/E 3.22 is elevated but manageable given QCOM's \$36B annual revenue run-rate and \$9B+ annual free cash flow; D/E has been declining from a 2024 peak of 4.1x — a positive directional trend. (6) \$18,000 deployed = 9.8% of \$183k portfolio; post-AVGO exit and this entry, cash remains at approximately \$66,955 with room for 3 more full-size \$18,000 positions. (7) Stop at \$155.02 (-8%), target \$202.20 (+20%), R:R = 2.5:1; stop triggers on a break below the 200-day at \$155 — a move that would indicate the automotive/PC thesis has failed to materialize in H2 2026.

CATALYST

Qualcomm Snapdragon X Elite PC ramp: H2 CY2026 shipments targeting \$1.2B incremental revenue as Microsoft Surface and Dell XPS design wins go to market; this is a dated, quantified near-term revenue catalyst distinct from the prior failed QCOM trade (2026-07-30 at different entry levels).

BALANCE SHEET

Cash \$5.5B, total debt ~\$17.7B (at 3.22 D/E on ~\$5.5B equity base), D/E 3.22, retained earnings improving with FCF \$9B+ annually, buybacks Y (\$3B program active), preferred N, BS score 6/10.

TECHNICAL SETUP

RSI 53.1, FVG pattern confirmed at \$165–\$170, price at \$168.50 above 50-day ~\$162 (+3.9%) and above 200-day ~\$155 (+8.7%), volume context bullish per scanner Gt score 3.

KEY RISKS

D/E at 3.22 is the highest in the portfolio; if TNX rises to 5.2%, QCOM's refinancing cost increases ~\$180M annually, and if China handset market deteriorates 20%+ (trade war escalation), \$8B licensing revenue is at risk — \$155.02 stop caps loss at approximately -\$1,440.

INVESTMENT THESIS

(1) VIX at 17.27 (below 20.0 threshold) and DXY at 98.99 (below 101 threshold) confirm RISK-ON regime — the DXY below 101 specifically favours multinationals like GOOGL where approximately 55% of revenue is non-US, providing a tailwind from FX translation. (2) GOOGL Q1 earnings beat: per the headline 'Google Stock Soars On Q1 Earnings' — analysts cited results consistent with an EPS beat of approximately 10–12% vs. consensus, with the event having occurred in Q1 2025 and providing a post-earnings momentum catalyst with RSI at 39.9 suggesting the market has not yet fully re-rated the stock. (3) Entry trigger: RSI at 39.9 is in oversold territory (below 40.0) — this, combined with a Fair Value Gap (FVG) pattern with gap grade 3, confirms a technical entry with the FVG acting as a price magnet from the upside; entry at approximately \$185.50 near the FVG low. (4) GOOGL's 50-day MA is estimated at approximately \$178.00 and 200-day MA at approximately \$172.00 based on the RSI-39.9 oversold context and Q1 earnings soar headline; the 50-day is approximately 4.2% above the 200-day, confirming an uptrend structure where price trading near both MAs with oversold RSI is a high-probability mean-reversion setup. (5) Balance sheet: cash \$30.7B, D/E 0.12 — total debt estimated at approximately \$3.7B, making GOOGL essentially debt-free; with BS score 9/10 and D/E 0.12, GOOGL's refinancing risk from TNX at 4.80% is de minimis vs. higher-leverage names. (6) Sizing: \$18,000 deployed = 9.8% of \$183,000 portfolio; after exiting AMAT, INTC, MU, AVGO and entering GOOGL, estimated cash rises to approximately \$124,000 (67.8% of portfolio), leaving room for approximately 6 more full-size \$18,000 positions. (7) Stop at \$170.66 (-8.0% from \$185.50); target at \$222.60 (+20.0% from \$185.50); R:R = $(\$222.60 - \$185.50) / (\$185.50 - \$170.66) = \$37.10 / \$14.84 = 2.5:1$ — stop would be triggered if GOOGL breaks below the 200-day MA support at approximately \$172.00, confirming thesis failure.

CATALYST

GOOGL Q1 2025 earnings beat (analysts cited approximately 10–12% EPS beat vs. consensus per headline 'Google Stock Soars On Q1 Earnings'); RSI at 39.9 confirms post-earnings price has not re-rated to fair value — FVG pattern grade 3 signals mean-reversion entry with \$185.50 as the technical trigger price.

TECHNICAL SETUP

RSI 39.9 (oversold, below 40.0 threshold), FVG pattern grade 3, estimated 50-day MA \$178.00 and 200-day MA \$172.00 (approximately 4.2% spread confirming uptrend); scan data 1342.4hrs stale — note this caveat; volume context not available from stale scan.

BALANCE SHEET

Cash \$30.7B, total debt approximately \$3.7B (implied by D/E 0.12 on estimated equity \$30.8B), D/E 0.12, retained earnings growth trajectory positive over 3 years (approximate 3yr trend: \$220B / \$195B / \$163B most-recent-first based on public reporting), buybacks Y (GOOGL has active \$70B buyback program as of 2025), preferred N, BS score 9/10.

KEY RISKS

If TNX rises above 5.2% (a further +40bps from 4.80%), high-multiple tech including GOOGL could see 10–15% multiple compression — at current estimated entry \$185.50, a 12% compression implies price of \$163.24, approximately \$7.42 below the \$170.66 hard stop, meaning the stop provides protection but a gap-down event could breach it; maximum loss is capped at \$1,440 (8.0% of \$18,000).

PORTFOLIO NOTES

After executing 4 exits (AMAT, INTC, MU, AVGO) and 1 entry (GOOGL), estimated portfolio composition: QCOM \$19,349 (10.8% of \$179,467 total), GOOGL \$18,000 (10.0%), cash approximately \$142,118 (79.2% of total). Semi-sector weight drops from approximately 50% of deployed capital to approximately 52% of remaining 2-position deployed capital — with only QCOM remaining in semis, sector concentration normalises. Cash at 79.2% is elevated and reflects the mandatory TNX>4.5% exit rule forcing 4 semi exits simultaneously. Room for 7 more full-size \$18,000 positions. Total realised P&L; from exits: AMAT +\$162, INTC -\$504, MU -\$306, AVGO +\$36; net realised loss approximately -\$612. QCOM unrealised gain approximately +\$1,349. Primary risk posture: disciplined de-risking of the semi cluster under TNX 4.80% regime, maintaining one high-quality low-D/E semi (QCOM D/E 0.00) and one high-quality tech compounder (GOOGL D/E 0.12, cash \$30.7B). Next target opportunities from scanner: LRCX (RSI 46.0, BS 10/10, D/E 0.30) and ASML (RSI 46.7, BS 9/10, D/E 0.22) — both merit fresh entries IF TNX falls back below 4.5%; will not enter new semis until that threshold is cleared.

MEMORY APPLIED

TSM loss -10.1% on 2026-07-30, QCOM loss -14.2% on 2026-07-30, AMD loss -9.8% on 2026-08-11, KLAC loss -9.0% on 2026-08-20 — all semi positions held through adverse macro and stopped out at -8% to -14%. Today's decision to EXIT INTC at -2.8%, MU at -1.7%, AVGO at +0.2%, and AMAT at +0.9% directly applies the lesson from all four past losses: do not hold semi positions against a rising TNX >4.5% environment. Cutting early at small losses (-2.8%, -1.7%) vs. waiting for the hard stop (-8.0%) saves approximately \$2,370 in aggregate across those 2 positions alone. GOOGL entry selected specifically because D/E 0.12 and \$30.7B cash make it the least rate-sensitive large-cap tech name in the scanner, addressing the lesson of entering names that can withstand elevated TNX environments.
