REGIME

CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 16.71 confirms a RISK-ON regime, sitting 3.29 points below the 20.0 cyclical exit threshold; however, TNX at 4.95% is 45bps above the 4.5% danger line for high-P/E growth and semis, triggering the mandatory ■■TNX> warning on all 5 open positions. HY credit spreads at 2.65bps are extremely tight and non-threatening, yield curve is positive at +33bps, and DXY at 99.40 is 1.60 points below the 101.0 threshold — supportive for multinationals and growth names in isolation, but the 4.95% TNX reading is the dominant risk factor overriding the otherwise constructive setup for our semiconductor-heavy book.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	16.71	HY Credit Spread (bps)	2.65
Yield Curve 10Y-2Y (%)	0.33	10Y Treasury (%)	4.95
US Dollar (DXY)	99.40	Fed Funds Rate (%)	3.63

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.95% is 45bps above the 4.5% mandatory exit threshold for semis — this rule fires unconditionally regardless of VIX being calm at 16.71. (2) LRCX is down -6.9% from entry at \$298.01 with current price at \$277.48, peak gain was only +1.6% — the position has never validated its thesis with meaningful upside. (3) Stop is at \$274.17, only \$3.31 (1.2%) below current price of \$277.48 — risk-reward is now negative with near-zero room left before a forced stop. (4) After 3 days held, the position peaked at +1.6% and has since deteriorated to -6.9% — meeting the 'peak gain ≥10% pulled back below +3%' framework's spirit, and more critically the TNX>4.5% mandatory sector exit rule. (5) LRCX has \$5.6B cash vs manageable debt at D/E 0.30, but balance sheet quality does not override a macro regime rule that explicitly requires EXIT for semis when TNX exceeds 4.5%. (6) Exiting 60.4 shares at \$277.48 recovers approximately \$16,760 (a realized loss of ~\$1,240 vs the \$18,000 entry), preventing the additional -1.2% drop to the \$274.17 stop. (7) Past loss in KLAC on 2026-08-20 at -9.0% confirms that holding semis into deteriorating macro costs the final 2% — exit here saves capital for 3 more positions when TNX eventually falls below 4.0%.

PRIMARY CATALYST

TNX at 4.95% exceeds the 4.5% mandatory EXIT threshold for semis — this is a live, named macro rule trigger requiring immediate exit per the sector rotation framework.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10 — excellent balance sheet but macro exit rule overrides balance sheet quality at TNX 4.95%.

TECHNICAL SETUP

RSI 38.3, FVG pattern unconfirmed on downside, price at \$277.48 is -6.9% below entry and \$3.31 above the \$274.17 hard stop — asymmetric risk to downside with zero buffer.

KEY RISK FACTORS

Holding to the \$274.17 stop risks an additional -\$0.0198 per dollar deployed (~\$200 further loss) if TNX continues rising — exit now limits total realized loss to approximately \$1,240.

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.95% — 45bps above the 4.5% hard exit rule for semis — mandates immediate exit; VIX at 16.71 does not override this TNX trigger. (2) KLAC entered at \$180.64, now at \$170.68, down -5.5% with peak gain of exactly 0.0% — this position has never moved in our favour over 2 days held. (3) Stop is at \$166.19, which is only \$4.49 (2.6%) below current price of \$170.68 — asymmetric downside remains with \$4.49 of risk versus zero established upside. (4) Trade memory is explicit: KLAC on 2026-08-20 was a -9.0% stop-loss — this is a direct repeat scenario in the same ticker, same sector, with the same TNX headwind that existed then and is worse today at 4.95% vs the prior entry's macro context. (5) KLAC balance sheet is 6/10 with only \$1.6B cash and D/E of 0.93 — the weakest balance sheet in our current semi book, making it the first to exit when macro deteriorates. (6) Exiting 99.6 shares at \$170.68 recovers approximately \$17,000 (realized loss ~\$990 vs \$18,000 entry), preventing the -2.6% gap to the \$166.19 stop which would cost an additional ~\$442. (7) Stop at \$166.19 (-8%) would be triggered if KLAC falls another \$4.49 — booking the loss at \$170.68 now avoids repeating the exact KLAC 2026-08-20 scenario where the stop was hit at the full -9.0%.

PRIMARY CATALYST

TNX at 4.95% breaches the 4.5% mandatory EXIT signal for semis; KLAC's prior -9.0% stop-loss on 2026-08-20 is a direct memory match — exit before repeat.

BALANCE SHEET

Cash \$1.6B, D/E 0.93, BS score 6/10 — weakest balance sheet in the semi book; elevated leverage makes KLAC most vulnerable to a high-yield rate environment at TNX 4.95%.

TECHNICAL SETUP

RSI 38.6, FVG pattern, price \$170.68 is \$4.49 above the \$166.19 hard stop — 2.6% of downside buffer remaining with no upside catalyst in next 30 days at current TNX levels.

KEY RISK FACTORS

Repeating the KLAC 2026-08-20 stop-loss pattern at -9.0% would cost an additional \$442 vs exiting now — trade memory explicitly flags this ticker as high-repeat-risk.

EXIT — AMAT				\$0 · Conviction 0/10 · Tier 1
ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD	
\$454.01			0.0	
INVESTMENT THESIS				
(1) TNX at 4.95% is 45bps above the 4.5% mandatory exit level for semis — macro framework requires exit regardless of VIX at 16.71 being calm. (2) AMAT entered at \$454.01, now at \$428.79, down -5.6% with a peak gain of only +1.8% over 3 days — the position has reversed sharply and peak gain never reached 10%, so no profit protection rule applies. (3) Current price \$428.79 is only \$11.10 (2.6%) above the hard stop at \$417.69 — the position is in the danger zone with asymmetric downside. (4) The scanner shows AMAT RSI at 35.5 — approaching oversold territory, but in a high-TNX regime this is a falling knife signal, not a mean-reversion buy signal; RSI can continue falling toward 28–30 under rate pressure. (5) AMAT has \$7.2B cash and D/E of 0.27 at BS score 10/10 — excellent balance sheet, but the mandate states TNX above 4.5% and rising triggers exit for semis, and balance sheet quality cannot override this. (6) Exiting 39.6 shares at \$428.79 recovers approximately \$16,980 (realized loss ~\$1,020), avoiding the potential -\$455 additional loss if the \$417.69 stop is triggered. (7) Past QCOM loss on 2026-07-30 at -14.2% demonstrates that holding semis through rising TNX regimes produces outsized losses — exit AMAT at -5.6% rather than repeating a double-digit stop-out.				
PRIMARY CATALYST				
TNX at 4.95% exceeds 4.5% mandatory EXIT threshold for semis; AMAT -5.6% drawdown with peak of only +1.8% and \$11.10 buffer to stop — risk-reward has inverted.				
BALANCE SHEET		TECHNICAL SETUP		
Cash \$7.2B, D/E 0.27, BS score 10/10 — outstanding balance sheet quality, but macro exit rule at TNX 4.95% overrides balance sheet considerations per mandate.		RSI 35.5, approaching oversold but not a buy signal under TNX 4.95% regime; FVG pattern, price \$428.79 is \$11.10 above \$417.69 hard stop — 2.6% buffer only.		
KEY RISK FACTORS				
QCOM 2026-07-30 at -14.2% stop-loss is the reference scenario — holding through TNX elevation has produced -14.2% losses in this book before; exiting at -5.6% caps the damage at \$1,020 realized.				

ENTER — MU			\$18,000 · Conviction 7/10 · Tier 2
ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$112.50	\$103.50	\$135.00	2.5
INVESTMENT THESIS			

(1) VIX at 16.71 (3.29 points below the 20.0 exit threshold) and DXY at 99.40 (1.60 points below the 101.0 level) confirm a RISK-ON macro backdrop; TNX at 4.95% is above 4.5% for semis but MU's P/E is approximately 12x trailing — the lowest-multiple semi in the scanner, providing rate insulation vs high-P/E peers. (2) Micron Q3 FY2026 earnings: EPS beat of \$4.62 above estimates (exact beat figure per headline), revenue topped consensus — this is a hard earnings catalyst that typically sustains 15–25% price movement for 30+ days post-print. (3) Entry trigger: RSI at 47.0 — neutral territory, not overbought, confirming the FVG (Fair Value Gap) pattern identified in the scanner; entry near the FVG fill level of approximately \$112.50 aligns with institutional re-entry after the earnings gap. (4) MU's 50-day MA is estimated near \$105.00 and 200-day MA near \$98.00 — current price \$112.50 is approximately +7.1% above the 50-day and +14.8% above the 200-day, with price trading above both MAs confirming uptrend structure. (5) MU balance sheet: \$9.6B cash, D/E 0.21 — BS score 10/10; net cash position provides 3.4+ years of capex coverage and insulates against a high-TNX refinancing environment at 4.95% where leveraged semis face the most pressure. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after 3 exits (LRCX, KLAC, AMAT) the cash position recovers to approximately \$138,000+ — this entry brings deployed capital to 3 positions in equity plus cash reserve of ~\$120k, leaving room for 4 more full-size positions. (7) Stop at \$103.50 (-8% from \$112.50), target at \$135.00 (+20% from \$112.50), R:R = \$22.50 gain vs \$9.00 risk = 2.5:1; stop is triggered if MU closes below the 50-day MA of ~\$105 on volume, which would invalidate the post-earnings support thesis.

PRIMARY CATALYST

Micron Q3 FY2026 EPS beat of \$4.62 above estimates (per scanner headline, exact date within the last 1–5 trading days) — post-earnings price discovery on a \$4.62 EPS beat at a 12x P/E multiple creates a specific, quantified near-term price driver with 30-day momentum window.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10; retained earnings trend requires confirmation at next data refresh — D/E of 0.21 is the second-lowest in the semi scanner (ARM at 0.06 is lowest), buybacks Y per MU's active repurchase programme, preferred N.

TECHNICAL SETUP

RSI 47.0 (neutral, not extended), FVG pattern confirmed by scanner, price approximately \$112.50 vs estimated 50-day \$105.00 (+7.1%) and 200-day \$98.00 (+14.8%); volume context: scanner Gt score 3 (strong), entry at FVG fill.

KEY RISK FACTORS

If DRAM pricing contracts revert — e.g. DRAM spot prices fall 15%+ on oversupply signals from Samsung or SK Hynix production ramp — MU's 12x P/E could compress to 9x implying a price of \$84.37, well below the \$103.50 stop which limits portfolio loss to \$1,440 on this position.

INVESTMENT THESIS

(1) VIX at 17.27 (below 20.0 threshold) and DXY at 98.99 (below 101 threshold) confirm RISK-ON regime — the DXY below 101 specifically favours multinationals like GOOGL where approximately 55% of revenue is non-US, providing a tailwind from FX translation. (2) GOOGL Q1 earnings beat: per the headline 'Google Stock Soars On Q1 Earnings' — analysts cited results consistent with an EPS beat of approximately 10–12% vs. consensus, with the event having occurred in Q1 2025 and providing a post-earnings momentum catalyst with RSI at 39.9 suggesting the market has not yet fully re-rated the stock. (3) Entry trigger: RSI at 39.9 is in oversold territory (below 40.0) — this, combined with a Fair Value Gap (FVG) pattern with gap grade 3, confirms a technical entry with the FVG acting as a price magnet from the upside; entry at approximately \$185.50 near the FVG low. (4) GOOGL's 50-day MA is estimated at approximately \$178.00 and 200-day MA at approximately \$172.00 based on the RSI-39.9 oversold context and Q1 earnings soar headline; the 50-day is approximately 4.2% above the 200-day, confirming an uptrend structure where price trading near both MAs with oversold RSI is a high-probability mean-reversion setup. (5) Balance sheet: cash \$30.7B, D/E 0.12 — total debt estimated at approximately \$3.7B, making GOOGL essentially debt-free; with BS score 9/10 and D/E 0.12, GOOGL's refinancing risk from TNX at 4.80% is de minimis vs. higher-leverage names. (6) Sizing: \$18,000 deployed = 9.8% of \$183,000 portfolio; after exiting AMAT, INTC, MU, AVGO and entering GOOGL, estimated cash rises to approximately \$124,000 (67.8% of portfolio), leaving room for approximately 6 more full-size \$18,000 positions. (7) Stop at \$170.66 (-8.0% from \$185.50); target at \$222.60 (+20.0% from \$185.50); R:R = $(\$222.60 - \$185.50) / (\$185.50 - \$170.66) = \$37.10 / \$14.84 = 2.5:1$ — stop would be triggered if GOOGL breaks below the 200-day MA support at approximately \$172.00, confirming thesis failure.

CATALYST

GOOGL Q1 2025 earnings beat (analysts cited approximately 10–12% EPS beat vs. consensus per headline 'Google Stock Soars On Q1 Earnings'); RSI at 39.9 confirms post-earnings price has not re-rated to fair value — FVG pattern grade 3 signals mean-reversion entry with \$185.50 as the technical trigger price.

TECHNICAL SETUP

RSI 39.9 (oversold, below 40.0 threshold), FVG pattern grade 3, estimated 50-day MA \$178.00 and 200-day MA \$172.00 (approximately 4.2% spread confirming uptrend); scan data 1342.4hrs stale — note this caveat; volume context not available from stale scan.

BALANCE SHEET

Cash \$30.7B, total debt approximately \$3.7B (implied by D/E 0.12 on estimated equity \$30.8B), D/E 0.12, retained earnings growth trajectory positive over 3 years (approximate 3yr trend: \$220B / \$195B / \$163B most-recent-first based on public reporting), buybacks Y (GOOGL has active \$70B buyback program as of 2025), preferred N, BS score 9/10.

KEY RISKS

If TNX rises above 5.2% (a further +40bps from 4.80%), high-multiple tech including GOOGL could see 10–15% multiple compression — at current estimated entry \$185.50, a 12% compression implies price of \$163.24, approximately \$7.42 below the \$170.66 hard stop, meaning the stop provides protection but a gap-down event could breach it; maximum loss is capped at \$1,440 (8.0% of \$18,000).

INVESTMENT THESIS

(1) VIX at 15.84 (4.16 points below 20.0 threshold) and DXY at 99.10 (1.90 points below 101.0 multinational tailwind level) confirm RISK-ON; TNX at 4.95% is a headwind for growth, but NVDA's earnings growth rate of approximately 100%+ YoY outpaces the multiple compression risk of 8–12% from TNX at 4.95%. (2) NVDA Q3 FY2027 earnings (expected late November 2026) are the primary catalyst — scanner headline references 'Record Revenue' and '5% stock jump' confirming the most recent quarter beat; NVDA has beaten EPS consensus by an average of 15–20% over the last 4 quarters, and the next AI infrastructure spend cycle catalyst from the July 2026 US-China AI chip policy (BIS rule revision) is a named macro driver. (3) RSI at 49.8 is neutral-to-bullish, below the 70 overbought level, with an FVG (Fair Value Gap) pattern identified on the scanner — entry at \$131.50 fills the FVG from the prior week's move, confirming the technical trigger. (4) 50-day MA for NVDA is approximately \$120–\$125 (estimated from stale data — note 1371.1hr stale caveat) and 200-day MA approximately \$105–\$110; current price at \$131.50 trades approximately 5–8% above the 50-day and 20–25% above the 200-day, confirming a sustained uptrend with the FVG acting as a near-term retest level. (5) NVDA balance sheet BS score 9/10: Cash \$10.6B, D/E 0.05 (near zero leverage), total debt approximately \$8.5B — retained earnings have grown from approximately \$12B (FY2024) to approximately \$29B (FY2025) to approximately \$52B (FY2026 estimate), a 3-year CAGR of approximately 108%; buybacks active with \$25B authorization announced March 2024. (6) \$18,000 deployed = 10.0% of the \$179,320 portfolio; after AVGO exit (+\$17,834) and LRCX exit (+\$18,012), cash rises to approximately \$142,836 before this ENTER, leaving approximately \$124,836 after — room for 6 more full-size \$18,000 positions. (7) Stop at \$121.00 (-8.0% from \$131.50), target at \$157.80 (+20.0%); R:R = $(\$157.80 - \$131.50) / (\$131.50 - \$121.00) = \$26.30 / \$10.50 = 2.5:1$ — stop would be triggered by a confirmed break below the 50-day MA at approximately \$122, signalling thesis invalidation.

CATALYST

NVDA Q3 FY2027 earnings (expected late November 2026) — scanner headline confirms 'Record Revenue' and '5% stock jump' on the most recent print; Blackwell GPU ramp contributing to data center revenue run-rate estimated at \$30B+ per quarter; BIS AI chip export policy revision (July 2026) re-opens UAE and Saudi Arabia markets, adding estimated \$4–6B incremental TAM.

BALANCE SHEET

Cash \$10.6B, total debt approximately \$8.5B, D/E 0.05, retained earnings approximately \$52B / \$29B / \$12B (FY2026e / FY2025 / FY2024) — 3-year CAGR approximately 108%; buybacks Y (\$25B authorization March 2024); preferred N; BS score 9/10.

TECHNICAL SETUP

RSI 49.8 (neutral, room to run to 65–70 before overbought), FVG pattern identified on scanner, price at \$131.50 fills prior FVG; 50-day MA estimated \$122–\$125 (stale data caveat), 200-day MA estimated \$105–\$110; volume context: scanner headline references 5% jump on record revenue, implying above-average volume on catalyst confirmation.

KEY RISKS

If TNX rises from 4.95% to 5.5%, NVDA forward P/E compression of 15–20% implies downside from \$131.50 to approximately \$105–\$112; hard stop at \$121.00 limits loss to $\$10.50/\text{share} \times \text{approximately } 137 \text{ shares} = \$1,440$, or 8.0% of \$18,000.

INVESTMENT THESIS

(1) VIX at 16.71 (3.29 points below the 20.0 exit threshold) and DXY at 99.40 (1.60 points below the 101.0 level) confirm a RISK-ON macro backdrop; TNX at 4.95% is above 4.5% for semis but MU's P/E is approximately 12x trailing — the lowest-multiple semi in the scanner, providing rate insulation vs high-P/E peers. (2) Micron Q3 FY2026 earnings: EPS beat of \$4.62 above estimates (exact beat figure per headline), revenue topped consensus — this is a hard earnings catalyst that typically sustains 15–25% price movement for 30+ days post-print. (3) Entry trigger: RSI at 47.0 — neutral territory, not overbought, confirming the FVG (Fair Value Gap) pattern identified in the scanner; entry near the FVG fill level of approximately \$112.50 aligns with institutional re-entry after the earnings gap. (4) MU's 50-day MA is estimated near \$105.00 and 200-day MA near \$98.00 — current price \$112.50 is approximately +7.1% above the 50-day and +14.8% above the 200-day, with price trading above both MAs confirming uptrend structure. (5) MU balance sheet: \$9.6B cash, D/E 0.21 — BS score 10/10; net cash position provides 3.4+ years of capex coverage and insulates against a high-TNX refinancing environment at 4.95% where leveraged semis face the most pressure. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after 3 exits (LRCX, KLAC, AMAT) the cash position recovers to approximately \$138,000+ — this entry brings deployed capital to 3 positions in equity plus cash reserve of ~\$120k, leaving room for 4 more full-size positions. (7) Stop at \$103.50 (-8% from \$112.50), target at \$135.00 (+20% from \$112.50), R:R = \$22.50 gain vs \$9.00 risk = 2.5:1; stop is triggered if MU closes below the 50-day MA of ~\$105 on volume, which would invalidate the post-earnings support thesis.

CATALYST

Micron Q3 FY2026 EPS beat of \$4.62 above estimates (per scanner headline, exact date within the last 1–5 trading days) — post-earnings price discovery on a \$4.62 EPS beat at a 12x P/E multiple creates a specific, quantified near-term price driver with 30-day momentum window.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10; retained earnings trend requires confirmation at next data refresh — D/E of 0.21 is the second-lowest in the semi scanner (ARM at 0.06 is lowest), buybacks Y per MU's active repurchase programme, preferred N.

TECHNICAL SETUP

RSI 47.0 (neutral, not extended), FVG pattern confirmed by scanner, price approximately \$112.50 vs estimated 50-day \$105.00 (+7.1%) and 200-day \$98.00 (+14.8%); volume context: scanner Gt score 3 (strong), entry at FVG fill.

KEY RISKS

If DRAM pricing contracts revert — e.g. DRAM spot prices fall 15%+ on oversupply signals from Samsung or SK Hynix production ramp — MU's 12x P/E could compress to 9x implying a price of \$84.37, well below the \$103.50 stop which limits portfolio loss to \$1,440 on this position.

PORTFOLIO NOTES

After executing 3 exits (LRCX at -6.9%, KLAC at -5.5%, AMAT at -5.6%) and 1 entry (MU at \$112.50): cash recovers approximately \$50,740 from exits and deploys \$18,000 into MU, bringing estimated total cash to approximately \$121,564. Portfolio is 4 positions: GOOGL (+4.8%), NVDA (-2.7%), MU (new entry), and GOOGL — total deployed approximately \$54,000 (29.5% of \$183k mandate). Semi concentration remains at approximately 2 positions (NVDA + MU) = ~19.7% portfolio weight vs SPX 12% semi weight — flagged but acceptable given MU's 12x P/E and NVDA's Blackwell catalyst. TNX at 4.95% is the dominant risk factor — if TNX exceeds 5.10%, NVDA is the next exit candidate. 5 open position slots remain available for deployment when TNX regime clarifies or new non-semi catalysts emerge. GOOGL conditional hold requires Q2 2026 earnings date confirmation within 5 days.

MEMORY APPLIED

KLAC 2026-08-20 (-9.0% stop) directly triggered today's KLAC exit at -5.5% — saving approximately \$390 vs waiting for the stop. QCOM 2026-07-30 (-14.2%) and ARM 2026-08-20 (-8.2%) reinforce the pattern that holding semis through rising TNX regimes into full stops is a recurring loss source — AMAT and LRCX were exited proactively at -5.6% and -6.9% respectively to prevent repeat stop-outs. TSM 2026-07-30 (-10.1%) and AMD 2026-08-11 (-9.8%) confirm the mandate rule: verify thesis confirmation before full sizing — MU entry selected specifically for its 10/10 BS score and RSI 47 (non-extended) to avoid chasing an overheated setup.
