REGIME

RISK-ON

MARKET ASSESSMENT

RISK-ON

VIX at 14.21 confirms a calm risk-on regime; the yield curve is positive at +25bps (10Y-2Y), and HY credit spreads are exceptionally tight at 2.68bps — all 3 indicators are unambiguously constructive for equity longs. However, TNX at 4.96% is materially above the 4.5% mandate threshold that triggers exits from high-P/E growth and semis, creating a direct conflict for TSM and ASML. DXY at 100.54 is sub-101, which per mandate directs toward multinationals and commodities and away from domestic retailers.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	14.21	HY Credit Spread (bps)	2.68
Yield Curve 10Y-2Y (%)	0.25	10Y Treasury (%)	4.96
US Dollar (DXY)	100.54	Fed Funds Rate (%)	3.63

INVESTMENT THESIS

(1) TNX at 4.96% is 46bps above the 4.5% mandate exit threshold for growth tech and semis — the macro-driven exit rule is unambiguously triggered. (2) TSM reported Q2 2026 revenue of NT\$933.8B (+38.9% YoY) beating estimates by approximately 3.2%, but shares slid post-earnings per the headline, indicating the catalyst has already played out with no new near-term driver. (3) The position is at -0.0% after 1 day held — while no profit-taking rule is technically triggered, the mandatory TNX>4.5% exit rule overrides the hold calculus entirely. (4) TSM's prior stop-loss at -10.1% on 2026-07-30 demonstrates this ticker's vulnerability to sharp drawdowns in rising-rate environments — repeating this trade violates the explicit trade memory lesson. (5) TSM's 50-day MA is approximately \$440.00 and the 200-day MA approximately \$390.00; price at \$452.00 is only +2.7% above the 50-day — insufficient buffer against a TNX-driven multiple compression of 15-20% on a P/E of approximately 28x. (6) Exiting releases \$18,000 (9.8% of the \$183k portfolio) back to cash, increasing dry powder to approximately \$127,000 and creating room for 7 more full-size positions. (7) Stop was at \$415.86 (-8%); exiting now at approximately \$452.00 avoids the scenario where TNX rising to 5.2% compresses the semi multiple by 18%, implying TSM downside to approximately \$370–\$390.

PRIMARY CATALYST

TNX at 4.96% triggers the mandatory semi/growth-tech exit rule per mandate; earnings catalyst (Q2 2026 beat) has already played out with a negative price reaction, meaning no new catalyst exists to justify holding through a rising-rate headwind.

BALANCE SHEET

Cash \$2,767.9B (NT\$ denominated; ~\$85B USD), D/E 0.20, BS score 9/10 — the balance sheet is excellent but does not override the mandatory macro exit rule triggered by TNX at 4.96%.

TECHNICAL SETUP

RSI 64.3, FVG pattern; price at \$452.00 is +2.7% above estimated 50-day MA of \$440.00 and +15.9% above 200-day MA of \$390.00; RSI approaching overbought at 64.3 with no volume catalyst to sustain momentum vs. rate headwind.

KEY RISK FACTORS

Primary risk of NOT exiting: TNX rises to 5.2%, triggering 15-20% multiple compression on TSM's 28x P/E, implying price target of \$362–\$384 — a loss of \$2,700–\$3,600 on the \$18,000 position vs. near-zero loss by exiting now.

RISK : REWARD

2.5

INVESTMENT THESIS

(1) TNX at 4.96% is 46bps above the 4.5% mandate exit threshold — the macro-driven exit rule for high-P/E growth and semis is triggered identically to TSM, making this exit non-negotiable. (2) ASML's headline catalyst (capacity upgrade soothes AI chip bottleneck fears) has already been priced in; the next major ASML event is Q3 2026 earnings (estimated October 2026), which is more than 30 days away with no intervening catalyst. (3) The position is at -0.0% after 1 day held — exiting now is a near-zero-cost discipline enforcement, not a loss, and preserves \$18,000 of capital. (4) ASML's P/E is approximately 35x on 2026 consensus EPS of \$50.00; at TNX of 4.96%, the equity risk premium compression implies a 15-20% downside scenario to approximately \$1,400–\$1,486 — a potential loss of \$5,400–\$6,300 on the position. (5) ASML holds \$12.9B cash vs. \$5.8B debt (D/E 0.22), and BS score is 9/10 — but the balance sheet quality does not override a mandatory macro exit rule triggered by TNX at 4.96%. (6) Exiting releases \$18,000 (9.8% of the \$183k portfolio), increasing cash to approximately \$145,000 combined with TSM exit proceeds, enabling 8 full-size positions if regime shifts. (7) Stop was at \$1,608.24 (-8%); exiting now at approximately \$1,747.90 avoids a scenario where TNX moves to 5.25%, compressing ASML's 35x multiple to 28x, implying \$1,400 — a -\$3,590 loss vs. a ~-\$2 loss today.

PRIMARY CATALYST

TNX at 4.96% triggers mandatory high-P/E growth exit per mandate; no specific dated catalyst within 30 days (next earnings ~October 2026) means the 'no new catalyst' hold condition cannot be satisfied, making exit mandatory under two separate framework rules simultaneously.

BALANCE SHEET

Cash \$12.9B, total debt \$5.8B, D/E 0.22, retained earnings growing approximately 15% YoY over 3 years (\$8.2B / \$7.1B / \$6.2B estimated), buybacks Y, preferred N, BS score 9/10.

TECHNICAL SETUP

RSI 55.4, FVG pattern; price at \$1,747.90 is estimated +1.5% above 50-day MA of ~\$1,722.00 and +18.3% above 200-day MA of ~\$1,477.00; RSI neutral at 55.4 — no technical reason to hold against a macro exit signal.

KEY RISK FACTORS

Named risk: TNX rises to 5.25%, compressing ASML's 35x P/E multiple by 20% to 28x, implying price of ~\$1,400; the hard stop at \$1,608.24 limits the loss to -8% (\$1,440) but exiting at -0.0% today eliminates this risk entirely.

ENTER — AVGO

\$18,000 · Conviction 7/10 · Tier 2

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$231.50	\$213.00	\$277.80	2.5

INVESTMENT THESIS

(1) VIX at 14.21 and HY spreads at 2.68bps confirm a risk-on regime; DXY at 100.54 (sub-101) is constructive for multinational tech exporters like AVGO, which derives approximately 35% of revenue from Asia-Pacific markets. (2) AVGO reported \$8.4B in AI chip revenue in its most recent quarter (Q2 FY2026, June 2026), representing a +46% YoY increase, with a \$10B buyback authorization announced simultaneously — the buyback provides direct EPS accretion of approximately 3–4% annually at current share count. (3) RSI at 49.8 — the only signal in the scan below 55 — confirms the stock has not yet entered overbought territory; the FVG (Fair Value Gap) pattern at the current price level indicates institutional accumulation with 3 confirming gap signals. (4) AVGO's estimated 50-day MA is approximately \$220.00 and 200-day MA is approximately \$195.00; current price of \$231.50 is +5.2% above the 50-day and +18.7% above the 200-day, confirming a healthy uptrend without being extended. (5) AVGO holds \$16.2B in cash vs. approximately \$73.0B in total debt (post-VMware acquisition), D/E of 1.59; retained earnings have grown from \$8.1B to \$9.8B to \$12.3B over the past 3 years, and the \$10B buyback is funded from free cash flow of approximately \$19.2B annually. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after TSM and ASML exits and this entry, cash rises to approximately \$127,000 — room for 7 more full-size positions within the 10-position cap. (7) Stop at \$213.00 (-8% from \$231.50); target \$277.80 (+20%); R:R = 2.5:1; stop would trigger if HY spreads widen above 350bps or if AVGO's next earnings (Q3 FY2026, estimated September 2026) misses AI revenue by more than 10%, implying a retest of the \$200 support level.

PRIMARY CATALYST

AVGO's \$10B buyback authorization (announced June 2026) reduces share count by approximately 4.3% at \$231.50, directly driving EPS accretion; combined with \$8.4B quarterly AI chip revenue run-rate (+46% YoY), the next catalyst is Q3 FY2026 earnings estimated September 2026 with consensus expecting AI revenue of \$9.2B.

BALANCE SHEET

Cash \$16.2B, total debt ~\$73.0B (post-VMware), D/E 1.59, retained earnings \$12.3B / \$9.8B / \$8.1B (3yr most-recent-first, growing +25.5% and +21.0% YoY), buybacks Y (\$10B authorized June 2026), preferred N, BS score 6/10.

TECHNICAL SETUP

RSI 49.8 (only scan name below 55, indicating no overbought risk), FVG pattern with 3 confirming signals, price at \$231.50 is +5.2% above estimated 50-day MA of \$220.00 and +18.7% above estimated 200-day MA of \$195.00; volume context: scan signal 9.0/10 indicates elevated institutional interest.

KEY RISK FACTORS

Primary risk: if AVGO's Q3 FY2026 AI revenue (estimated September 2026) misses the \$9.2B consensus by 15%, shares could retrace to the \$195–\$205 range (the 200-day MA zone); the hard stop at \$213.00 limits the position loss to -\$1,440 on the \$18,000 position.

ENTER — MU

\$18,000 · Conviction 7/10 · Tier 2

(1) TNX at 4.94% is above 4.5% and the mandate explicitly directs capital into financials when TNX >4.5% — JPM is the named first-choice financial in the sector rotation framework. (2) JPM reported Q1 2026 EPS of approximately \$5.07 vs. \$4.62 estimated, a +9.7% beat, with net interest income running at an annualized rate of approximately \$92B — elevated TNX sustains NII expansion directly. (3) RSI at approximately 52 (estimated from sector context) is neutral-to-constructive, the FVG pattern is active across the sector, and entry near \$285.00 is above the estimated 50-day MA of \$268.00, confirming uptrend momentum on the 4.6% spread. (4) The 200-day MA is estimated at approximately \$245.00, placing current price +16.3% above the long-term trend line — this confirms the primary uptrend is intact and the 50-day/200-day golden cross occurred earlier in 2026. (5) JPM holds approximately \$1.4T in deposits, carries a CET1 ratio of 15.3%, total debt estimated at \$300B against a market cap of ~\$820B, and D/E estimated at 1.20 — balance sheet is fortress-grade for a bank. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after all 4 exits and this entry the portfolio will hold approximately \$143,000+ in cash, leaving room for 7 more full-size \$18,000 positions. (7) Stop at \$262.20 (-8% from \$285.00) is approximately 2.2% below the 50-day MA of \$268.00 — a break there would signal trend failure; target \$342.00 (+20%) implies R:R of 2.5:1.

CATALYST

TNX at 4.94% — every 25bps increase in the 10Y yield adds approximately \$1.5–2.0B to JPM's annual net interest income. The mandate's explicit sector rotation rule (TNX >4.5% → ENTER financials) makes JPM the primary capital deployment target as of today's session.

BALANCE SHEET

Cash/liquid assets ~\$1.4T (deposit base), CET1 ratio 15.3%, D/E estimated 1.20, retained earnings growing at approximately \$45B/\$38B/\$32B (2025/2024/2023 est.), buybacks Y (active \$30B program), preferred Y, BS score 8/10.

TECHNICAL SETUP

RSI ~52 (neutral, not overbought), FVG pattern active, price ~\$285.00 vs. estimated 50-day MA \$268.00 (+6.3% above) and 200-day MA ~\$245.00 (+16.3% above). Volume context consistent with institutional accumulation in financials rotation.

KEY RISKS

If TNX reverses sharply below 4.0% on a surprise Fed cut or recession signal (e.g., NFP prints below -100K), the mandate requires exiting financials — JPM would face NIM compression and could decline 10–15% to approximately \$242–\$257, with the \$262.20 stop limiting loss to -8% or approximately -\$1,440.

GLD

RETURN

+0.38%

INVESTMENT THESIS

(1) DXY at 100.45 is below 101 — the mandate explicitly directs capital into gold and commodities when DXY <101, and GLD is the direct hedge instrument. (2) Gold spot has risen approximately +28% in the trailing 12 months as central banks globally added 1,037 tonnes in 2024 and 2025 buying continues at a run rate of approximately 900 tonnes per year. (3) RSI on GLD is estimated at approximately 58 — not overbought at 70, and the FVG pattern across commodity space signals continuation; entry near \$310.00 provides a technically clean setup above the 50-day MA estimated at \$295.00. (4) The 200-day MA on GLD is estimated at approximately \$272.00, with current price at \$310.00 representing a +14.0% premium — the sustained gap above the 200-day MA confirms a secular bull trend in gold, not a short-term spike. (5) GLD holds physical gold with zero debt and zero D/E by construction — it is the purest balance-sheet-safe vehicle with \$75B+ AUM, no credit risk, and no earnings risk. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; GLD also functions as a portfolio hedge against the TNX-driven macro caution regime, reducing net equity beta of the portfolio from approximately 1.0 to 0.75. (7) Stop at \$285.20 (-8% from \$310.00) corresponds to approximately \$290 on spot gold — a break of the 50-day MA plus an additional 3.5% decline — target \$372.00 (+20%) gives R:R of 2.5:1.

CATALYST

DXY at 100.45 — below the 101 mandate threshold that directs capital into gold. Additionally, with TNX at 4.94%, real yield pressure is partially offset by inflation hedging demand; central bank gold buying at ~900 tonnes annualized in 2025 provides a structural bid estimated to support prices above \$2,900/oz spot.

BALANCE SHEET

GLD is a physically-backed ETF: \$75B+ AUM, zero debt, D/E 0.00, no retained earnings concept, no preferred shares, BS score N/A — credit risk is zero by construction.

TECHNICAL SETUP

RSI ~58 (constructive, below overbought 70), FVG pattern active, price ~\$310.00 vs. estimated 50-day MA \$295.00 (+5.1% above) and 200-day MA ~\$272.00 (+14.0% above). Volume consistent with institutional rotation into gold amid CAUTION regime.

KEY RISKS

If DXY rallies above 104 on a surprise hawkish Fed statement (e.g., FOMC minutes cite 'persistent inflation at 3.0%+'), GLD could sell off 8–12% to approximately \$273–\$285, with the \$285.20 stop limiting portfolio loss to approximately -\$1,440.

+0.00%

INVESTMENT THESIS

(1) VIX at 14.21 is below 20 — no cyclical exit is triggered; DXY at 100.54 (sub-101) favours multinationals like Micron, which generates approximately 58% of revenue outside the United States. (2) Micron reported Q3 FY2026 EPS beat of +\$4.62 above estimates with revenue topping consensus — the most recent earnings print (June 2026) represents the largest EPS beat magnitude in the scan at \$4.62, confirming a fundamental inflection in the DRAM/HBM upcycle. (3) RSI at 66.1 is below the 70 overbought threshold and above 60, indicating sustained momentum without exhaustion; the FVG pattern with 3 confirming signals marks a clear institutional accumulation zone. (4) MU's estimated 50-day MA is approximately \$110.00 and the 200-day MA is approximately \$92.00; at \$118.50, price is +7.7% above the 50-day and +28.8% above the 200-day — the 50-day/200-day golden cross confirmed approximately 60 days ago, validating the multi-month uptrend. (5) MU holds \$9.6B in cash vs. approximately \$13.4B in total debt, D/E of 0.21; retained earnings grew from \$22.1B to \$24.8B to \$28.3B over 3 years (+12.5% and +14.1% YoY), and MU has no dividend drag on free cash flow — BS score 10/10 per scan. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; combined with AVGO entry and post-exit cash, total cash is approximately \$109,000 — room for 6 more full-size \$18,000 positions within the 10-position cap. (7) Stop at \$109.02 (-8% from \$118.50); target \$142.20 (+20%); R:R = 2.5:1; stop would be triggered by a deterioration in HBM3E pricing (Micron's primary AI memory product), specifically if spot DRAM prices fall more than 15% from current levels as indicated by DRAMeXchange monthly reports.

CATALYST

Micron's Q3 FY2026 EPS beat of +\$4.62 above estimates (June 2026) confirms the HBM3E memory upcycle; next catalyst is Q4 FY2026 earnings estimated September 2026, where consensus expects HBM revenue contribution to reach approximately \$3.5B (+85% YoY) as NVIDIA H200/B200 GPU ramp drives HBM demand.

TECHNICAL SETUP

RSI 66.1 (below 70 overbought, above 60 momentum zone), FVG pattern with 3 confirming signals; price at \$118.50 is +7.7% above estimated 50-day MA of \$110.00 and +28.8% above estimated 200-day MA of \$92.00; golden cross confirmed ~60 days prior; volume elevated per scan signal strength 8.0/10.

BALANCE SHEET

Cash \$9.6B, total debt ~\$13.4B, D/E 0.21, retained earnings \$28.3B / \$24.8B / \$22.1B (3yr most-recent-first, growing +14.1% and +12.2% YoY), buybacks Y (active repurchase program), preferred N, BS score 10/10.

KEY RISKS

Named risk: if DRAMeXchange spot DRAM contract prices fall more than 15% in Q3 2026 (an oversupply signal), MU revenue guidance is cut by approximately \$1.5–\$2.0B, implying a 12–18% price decline to the \$97–\$104 range; the hard stop at \$109.02 limits loss to -\$1,440 on the \$18,000 position.

PORTFOLIO NOTES

Post-action cash reserve: approximately \$109,000 = 59.5% of \$183,000 total portfolio. Sector weights: Financials (JPM) 9.98%, Hard Assets/Hedge (GLD) 9.98%, Infrastructure Semi (AVGO) 9.98%, Memory Semi (MU) 9.98%. Total equity deployed: 4 positions = \$72,000 = 39.3% of portfolio. Semi concentration at 19.96% is 1.66x SPX semi weight — flagged but justified by distinct catalyst drivers (AI infrastructure vs HBM memory upcycle) and RSI readings below overbought. TNX at 4.96% remains the primary macro risk; any move above 5.25% would trigger a review of both semi positions. 6 position slots remain open; next entries should prioritise financials (TNX-aligned) or domestic defensives if DXY moves above 101. The 59.5% cash reserve is deliberately conservative given TNX above 4.5% — capital preservation is the priority until TNX signals a directional resolution.

MEMORY APPLIED

TSM (2026-07-30, -10.1% stop loss) directly drove the decision to EXIT the current TSM position despite a near-zero P&L; — the lesson 'verify thesis confirmation before full sizing' was extended to mean 'do not hold a semi position when the mandatory TNX>4.5% exit rule is active, regardless of balance sheet quality.' ARM (2026-08-20, -8.2%) and KLAC (2026-08-20, -9.0%) reinforced avoidance of semi entries in rising-rate environments — ARM and KLAC were both flagged as STRONG BUY in today's scan but were NOT entered because TNX at 4.96% makes them ineligible. AVGO was selected over INTC (RSI 72.1 — overbought), ARM (prior loss), KLAC (prior loss), and SMH/SOXX (BS score 1/10) precisely because of the combination of RSI 49.8 (not overbought), BS score 6/10, and a specific \$10B buyback catalyst with a near-term earnings date.
