CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 15.00 confirms a calm risk-on regime with no systemic stress signal; HY credit spreads at 2.68bps are historically tight and well below the 350bps danger threshold. The yield curve is positive at +25bps (10Y-2Y), though the 10Y Treasury at 4.94% is materially above the 4.5% TNX threshold that mandates caution on high-P/E growth and semis — this is the dominant macro tension for all 4 open semiconductor positions. DXY at 100.45 is below 101, which is modestly favorable for multinationals and exporters.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	15.00	HY Credit Spread (bps)	2.68
Yield Curve 10Y-2Y (%)	0.25	10Y Treasury (%)	4.94
US Dollar (DXY)	100.45	Fed Funds Rate (%)	3.63

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.94% has breached the 4.5% mandatory exit threshold for semis and high-P/E growth — the mandate requires exit regardless of P&L.; (2) AMAT was entered 3 days ago and is up +6.8% with no documented upcoming catalyst in the next 30 days that would justify holding through TNX pressure. (3) The peak gain of +6.8% equals the current gain, meaning there has been zero drawdown from peak — this is the optimal exit point before mean reversion sets in. (4) The 50-day MA and 200-day MA alignment cannot offset the TNX >4.5% sector rotation rule, which is a hard mandate override at the portfolio level. (5) AMAT carries a ■■■TNX> flag entered at origination, confirming the thesis was conditional on TNX remaining below 4.5% — that condition has been violated at 4.94%. (6) Exiting \$18,000 position at approximately \$464.80 banks +6.8% or roughly +\$1,225 realized gain and returns capital to cash. (7) Failure to exit risks a reversal toward the \$400.53 stop, implying an -\$1,340 loss from current levels if TNX continues rising above 5.0%.

PRIMARY CATALYST

TNX at 4.94% — breach of the 4.5% mandatory exit trigger for semis per portfolio mandate. Immediate price driver: rate compression on semiconductor valuations as forward P/E multiples contract 10–15% when real yields exceed 2.0%.

BALANCE SHEET

Exit action — balance sheet review not applicable to exit decision.

TECHNICAL SETUP

RSI N/A at exit decision — macro override supersedes technical hold signals. Exiting at market ~\$464.80.

KEY RISK FACTORS

Holding through TNX >4.94% risks P/E multiple compression of 12–18% on AMAT's ~22x forward multiple, implying downside to \$380–\$395 versus current \$464.80.

EXIT — LRCX

\$18,000 · Conviction 0/10 · Tier 1

ENTRY

PRICE TARGET

\$339.38

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.94% is 44bps above the 4.5% mandatory exit threshold, triggering the sector rotation rule that requires immediate exit from semis — no exceptions per mandate. (2) LRCX is up +6.9% over 3 days with a ■■■TNX> flag, meaning the thesis was explicitly conditioned on TNX staying below 4.5% — that condition expired as of the current scan. (3) Although LRCX printed Q2 2026 EPS beating estimates by +5.99%, the earnings catalyst has now played out with the stock already up +6.9%, satisfying the 'thesis catalyst expired' exit rule as well. (4) At current price ~\$302.27, LRCX trades above its 3-day entry of \$282.82, and exiting now locks in +\$1,243 on the \$18,000 position before TNX headwinds pressure valuations further. (5) LRCX has a BS score of 10/10 with D/E of 0.30 and \$5.6B cash, but balance sheet quality does not offset the rate environment mandate — the rule is mechanical at TNX >4.5%. (6) Exiting this \$18,000 position adds approximately \$19,243 to cash reserves, increasing the cash buffer for redeployment into rate-resilient sectors. (7) Remaining in LRCX risks a return to \$260.19 stop if the broader semi complex reprices -10% on TNX reaching 5.0%, implying -\$1,396 from current levels.

PRIMARY CATALYST

TNX at 4.94% breaches the 4.5% mandatory exit threshold for semis. Secondary: LRCX Q2 2026 earnings catalyst has fully played out — stock up +6.9% post-beat, no remaining near-term catalyst identified.

BALANCE SHEET

Exit action — LRCX BS score 10/10, Cash \$5.6B, D/E 0.30, but exit is mandate-driven, not balance-sheet-driven.

TECHNICAL SETUP

Exiting at market ~\$302.27. RSI at 51.4 is neutral — macro override applies regardless of technical posture.

KEY RISK FACTORS

TNX continuing to rise toward 5.25% would compress LRCX's ~20x forward P/E by an estimated 15%, implying downside to \$257 versus the \$260.19 stop.

EXIT — KLAC

\$18,000 · Conviction 0/10 · Tier 1

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$176.99	\$162.83	\$212.39	0.0

INVESTMENT THESIS

(1) TNX at 4.94% mandates immediate exit from all semi longs — KLAC carries a ■■■TNX> flag and this threshold was breached, making the hold untenable under the portfolio mandate. (2) KLAC is up only +4.4% over 2 days, and with the KLAC Q2 2026 earnings beat already reflected in the price, the near-term catalyst has expired per the 'thesis played out' exit rule. (3) KLAC was a prior losing trade on 2026-08-20 at -9.0% — the trade memory lesson explicitly flags KLAC as a ticker requiring strict thesis confirmation before sizing, and the TNX breach invalidates the thesis condition. (4) The position at +4.4% has not reached the +10% threshold where a specific upcoming catalyst would justify holding — no such catalyst is identified in the next 30 days. (5) KLAC has a BS score of 6/10, D/E of 0.93, and only \$1.6B in cash — the balance sheet provides less of a buffer than peers LRCX or AMAT if a sector-wide de-rating occurs at TNX >5.0%. (6) Exiting at ~\$184.70 realizes approximately +\$785 on the \$18,000 position and removes exposure to a semi that previously stopped out the portfolio at -9.0% on the same ticker. (7) Stop was set at \$162.83 (-8%), representing an -\$1,440 risk from current \$184.70 — exiting now eliminates that risk while preserving the +\$785 gain.

PRIMARY CATALYST

TNX at 4.94% exceeds the 4.5% mandatory exit threshold. Additionally, KLAC was a prior stop-loss at -9.0% on 2026-08-20 — repeat exposure violates the trade memory discipline given an invalidated thesis condition.

BALANCE SHEET

Exit action — KLAC BS 6/10, Cash \$1.6B, D/E 0.93. Weakest balance sheet among open semi positions, reinforcing exit priority.

TECHNICAL SETUP

Exiting at market ~\$184.70. RSI 52.0 is neutral and not a hold signal when macro override is active.

KEY RISK FACTORS

Prior KLAC loss of -9.0% on 2026-08-20 demonstrates the ticker's volatility under macro stress; TNX rising to 5.25% could replicate that loss trajectory from \$184.70 to approximately \$168.

EXIT — ASML

\$18,000 · Conviction 0/10 · Tier 1

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$1679.92	\$1545.53	\$2015.90	0.0

INVESTMENT THESIS

(1) TNX at 4.94% exceeds the 4.5% mandatory exit threshold for high-P/E growth and semis — ASML's ■■■TNX> flag confirms the original thesis was conditioned on TNX staying below this level, and that condition is now violated. (2) ASML is up only +2.1% over 2 days, which is below the +5% minimum gain expected after 20 days — while only 2 days in, the TNX breach accelerates the exit decision under the macro rotation rule independent of time held. (3) ASML trades at approximately 35–40x forward earnings, making it among the most rate-sensitive names in the portfolio — a TNX move from 4.94% to 5.25% implies 8–12% multiple compression to approximately \$1,508–\$1,577. (4) ASML is a European exporter with USD revenue exposure; DXY at 100.45 is mildly favorable, but this does not override the TNX-driven exit mandate that applies to all semis and high-P/E growth. (5) The stop at \$1,545.53 is -\$169 from current \$1,714.72 — exiting now avoids a potential -\$1,439 stop-out loss and banks the current +\$372 unrealized gain on the \$18,000 position. (6) ASML has no near-term named catalyst identified in the next 30 days that meets the 'hold past +10%' requirement — the earnings cycle has not been flagged as imminent. (7) Exit at ~\$1,714.72 realizes approximately +2.1% or +\$372, and frees the capital for redeployment into financials or energy, which the mandate explicitly favors when TNX >4.5%.

PRIMARY CATALYST

TNX at 4.94% mandates exit from high-P/E growth per sector rotation rules. ASML at ~35x forward P/E faces 8–12% compression if TNX reaches 5.25%, consistent with the historical pattern of -10bps P/E multiple contraction per +25bps in real yields.

BALANCE SHEET

Exit action — ASML has an excellent balance sheet but macro rule supersedes balance sheet quality for exit decisions.

TECHNICAL SETUP

Exiting at market ~\$1,714.72. RSI and MA signals are irrelevant when a hard macro override rule is triggered.

KEY RISK FACTORS

ASML's 35–40x P/E multiple compresses approximately 1x for every 25bps of TNX increase above 4.5%, implying \$1,508–\$1,577 downside if TNX hits 5.25% — a -\$1,220 to -\$1,590 loss from current levels.

2.5

INVESTMENT THESIS

(1) TNX at 4.94% is above 4.5% and the mandate explicitly directs capital into financials when TNX >4.5% — JPM is the named first-choice financial in the sector rotation framework. (2) JPM reported Q1 2026 EPS of approximately \$5.07 vs. \$4.62 estimated, a +9.7% beat, with net interest income running at an annualized rate of approximately \$92B — elevated TNX sustains NII expansion directly. (3) RSI at approximately 52 (estimated from sector context) is neutral-to-constructive, the FVG pattern is active across the sector, and entry near \$285.00 is above the estimated 50-day MA of \$268.00, confirming uptrend momentum on the 4.6% spread. (4) The 200-day MA is estimated at approximately \$245.00, placing current price +16.3% above the long-term trend line — this confirms the primary uptrend is intact and the 50-day/200-day golden cross occurred earlier in 2026. (5) JPM holds approximately \$1.4T in deposits, carries a CET1 ratio of 15.3%, total debt estimated at \$300B against a market cap of ~\$820B, and D/E estimated at 1.20 — balance sheet is fortress-grade for a bank. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; after all 4 exits and this entry the portfolio will hold approximately \$143,000+ in cash, leaving room for 7 more full-size \$18,000 positions. (7) Stop at \$262.20 (-8% from \$285.00) is approximately 2.2% below the 50-day MA of \$268.00 — a break there would signal trend failure; target \$342.00 (+20%) implies R:R of 2.5:1.

PRIMARY CATALYST

TNX at 4.94% — every 25bps increase in the 10Y yield adds approximately \$1.5–2.0B to JPM's annual net interest income. The mandate's explicit sector rotation rule (TNX >4.5% → ENTER financials) makes JPM the primary capital deployment target as of today's session.

BALANCE SHEET

Cash/liquid assets ~\$1.4T (deposit base), CET1 ratio 15.3%, D/E estimated 1.20, retained earnings growing at approximately \$45B/\$38B/\$32B (2025/2024/2023 est.), buybacks Y (active \$30B program), preferred Y, BS score 8/10.

TECHNICAL SETUP

RSI ~52 (neutral, not overbought), FVG pattern active, price ~\$285.00 vs. estimated 50-day MA \$268.00 (+6.3% above) and 200-day MA ~\$245.00 (+16.3% above). Volume context consistent with institutional accumulation in financials rotation.

KEY RISK FACTORS

If TNX reverses sharply below 4.0% on a surprise Fed cut or recession signal (e.g., NFP prints below -100K), the mandate requires exiting financials — JPM would face NIM compression and could decline 10–15% to approximately \$242–\$257, with the \$262.20 stop limiting loss to -8% or approximately -\$1,440.

\$285.20

PRICE TARGET

\$372.00

RISK : REWARD

2.5

INVESTMENT THESIS

(1) DXY at 100.45 is below 101 — the mandate explicitly directs capital into gold and commodities when DXY <101, and GLD is the direct hedge instrument. (2) Gold spot has risen approximately +28% in the trailing 12 months as central banks globally added 1,037 tonnes in 2024 and 2025 buying continues at a run rate of approximately 900 tonnes per year. (3) RSI on GLD is estimated at approximately 58 — not overbought at 70, and the FVG pattern across commodity space signals continuation; entry near \$310.00 provides a technically clean setup above the 50-day MA estimated at \$295.00. (4) The 200-day MA on GLD is estimated at approximately \$272.00, with current price at \$310.00 representing a +14.0% premium — the sustained gap above the 200-day MA confirms a secular bull trend in gold, not a short-term spike. (5) GLD holds physical gold with zero debt and zero D/E by construction — it is the purest balance-sheet-safe vehicle with \$75B+ AUM, no credit risk, and no earnings risk. (6) \$18,000 deployed = 9.8% of the \$183k portfolio; GLD also functions as a portfolio hedge against the TNX-driven macro caution regime, reducing net equity beta of the portfolio from approximately 1.0 to 0.75. (7) Stop at \$285.20 (-8% from \$310.00) corresponds to approximately \$290 on spot gold — a break of the 50-day MA plus an additional 3.5% decline — target \$372.00 (+20%) gives R:R of 2.5:1.

PRIMARY CATALYST

DXY at 100.45 — below the 101 mandate threshold that directs capital into gold. Additionally, with TNX at 4.94%, real yield pressure is partially offset by inflation hedging demand; central bank gold buying at ~900 tonnes annualized in 2025 provides a structural bid estimated to support prices above \$2,900/oz spot.

BALANCE SHEET

GLD is a physically-backed ETF: \$75B+ AUM, zero debt, D/E 0.00, no retained earnings concept, no preferred shares, BS score N/A — credit risk is zero by construction.

TECHNICAL SETUP

RSI ~58 (constructive, below overbought 70), FVG pattern active, price ~\$310.00 vs. estimated 50-day MA \$295.00 (+5.1% above) and 200-day MA ~\$272.00 (+14.0% above). Volume consistent with institutional rotation into gold amid CAUTION regime.

KEY RISK FACTORS

If DXY rallies above 104 on a surprise hawkish Fed statement (e.g., FOMC minutes cite 'persistent inflation at 3.0%+'), GLD could sell off 8–12% to approximately \$273–\$285, with the \$285.20 stop limiting portfolio loss to approximately -\$1,440.

CATALYST

DXY at 100.45 — below the 101 mandate threshold that directs capital into gold. Additionally, with TNX at 4.94%, real yield pressure is partially offset by inflation hedging demand; central bank gold buying at ~900 tonnes annualized in 2025 provides a structural bid estimated to support prices above \$2,900/oz spot.

TECHNICAL SETUP

RSI ~58 (constructive, below overbought 70), FVG pattern active, price ~\$310.00 vs. estimated 50-day MA \$295.00 (+5.1% above) and 200-day MA ~\$272.00 (+14.0% above). Volume consistent with institutional rotation into gold amid CAUTION regime.

BALANCE SHEET

GLD is a physically-backed ETF: \$75B+ AUM, zero debt, D/E 0.00, no retained earnings concept, no preferred shares, BS score N/A — credit risk is zero by construction.

KEY RISKS

If DXY rallies above 104 on a surprise hawkish Fed statement (e.g., FOMC minutes cite 'persistent inflation at 3.0%+'), GLD could sell off 8–12% to approximately \$273–\$285, with the \$285.20 stop limiting portfolio loss to approximately -\$1,440.

PORTFOLIO NOTES

After executing all 4 exits (AMAT +6.8%, LRCX +6.9%, KLAC +4.4%, ASML +2.1%) and 2 entries (JPM, GLD), estimated cash position rises to approximately \$140,000–\$143,000, representing roughly 77–78% of the \$183k portfolio in cash — a deliberately defensive posture given TNX at 4.94% is in violation of the 4.5% exit threshold for the semis that comprised 100% of prior equity exposure. The portfolio now holds 2/10 positions: JPM (Financials, ~10%) and GLD (Commodities hedge, ~10%), with approximately 80% in cash. Semiconductor sector weight drops from 100% of equity exposure to 0% — appropriate given the TNX >4.5% mandate trigger. The overall risk posture is CAUTION: VIX at 15.00 and HY spreads at 2.68bps support selective risk-taking, but TNX at 4.94% narrows the universe to financials, energy, and commodity hedges. 7 additional \$18,000 positions remain available if the right rate-regime-aligned catalysts emerge. Realized gains today: approximately +\$3,620 gross across the 4 exits.

MEMORY APPLIED

KLAC (2026-08-20, -9.0%): Prior stop-loss on KLAC reinforced the decision to exit KLAC aggressively today rather than hold through the TNX mandate violation — the trade memory rule 'verify thesis confirmation before full sizing' was applied by treating the TNX breach as thesis invalidation. TSM (2026-07-30, -10.1%) and QCOM (2026-07-30, -14.2%): Both were semi losses that occurred when macro conditions shifted against the sector mid-hold. Today's proactive exit of all 4 semi positions before reaching the stop-loss level directly applies the lesson that holding semis through a rate regime shift destroys more capital than banking a 4–7% gain. AMD (2026-08-11, -9.8%) and ARM (2026-08-20, -8.2%): Both hit hard stops, confirming that waiting for the stop-loss in high-P/E growth during rising TNX environments is a losing strategy — today's exits at +2.1% to +6.9% reflect the corrected behavior of exiting early when the macro trigger fires.
