MARKET ASSESSMENT

CAUTION

VIX at 18.43 is below the 20 risk-off threshold but elevated vs. the 16.78 level at entry for current positions, suggesting modest volatility creep of +1.65 points since entry. The 10Y Treasury at 4.97% is 47 basis points ABOVE the 4.50% TNX danger line flagged in the mandate, which is a hard macro signal to EXIT high-P/E growth and semis — this is the dominant risk factor today. HY spreads at 2.76bps are anomalously tight (likely a data artefact given typical HY spreads are 200-400bps), and the yield curve is +33bps positive; however TNX at 4.97% overrides the otherwise risk-on credit signal for semi longs.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	18.43	HY Credit Spread (bps)	2.76
Yield Curve 10Y-2Y (%)	0.33	10Y Treasury (%)	4.97
US Dollar (DXY)	100.31	Fed Funds Rate (%)	3.63

INVESTMENT THESIS

(1) TNX at 4.97% is 47bps above the 4.50% mandate threshold — the framework requires EXIT high-P/E semis when TNX is above 4.50% and rising, and this position carries a ■■■TNX> flag from entry. (2) LRCX entered at \$270.55 on Q1 earnings outperformance catalyst; that earnings event has now played out and no new dated catalyst exists within the next 30 days to justify holding through a 4.97% yield environment. (3) Current price \$267.51 represents -1.1% P&L; with peak gain of 0.0%, meaning the position has never moved into profit — the 'peak gain ≥10% but pulled back' rule does not apply, but the dead-money rule is approaching after 1 day. (4) RSI at 35.6 is oversold but a falling knife in a 4.97% TNX regime where semis face 15-20% multiple compression — RSI support is not sufficient to override the macro mandate exit signal. (5) Cash \$5.6B and D/E 0.30 are pristine, BS score 10/10, but balance sheet quality cannot offset the rate-driven P/E compression risk at TNX 4.97% vs. 4.50% trigger. (6) Exiting \$18,000 position returns capital to cash, bringing total cash to approximately \$121,814 and freeing 1 position slot against the 10-position maximum. (7) Stop was set at \$248.91 (-8% from \$270.55); the TNX mandate exit at 4.97% triggers before the stop is reached, protecting the -1.1% loss rather than risking a full -8% drawdown of \$1,440.

PRIMARY CATALYST

TNX at 4.97% exceeds the 4.50% mandate exit threshold by 47bps — per the framework this is a hard EXIT signal for semis regardless of company fundamentals.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10 — balance sheet is sound but irrelevant to the rate-driven exit decision.

TECHNICAL SETUP

RSI 35.6 (oversold but in downtrend), FVG pattern, price \$267.51 below entry \$270.55, volume context stale at 1488.8hrs — technical confirmation is insufficient to override TNX macro exit rule.

KEY RISK FACTORS

TNX at 4.97% drives 15-20% P/E multiple compression on semis; staying in risks a move from -1.1% to the -8% stop at \$248.91, a further \$183 loss per share on 66.5 shares = \$12,175 incremental downside.

PRICE TARGET

\$502.82

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.97% is 47bps above the 4.50% mandate exit trigger for semis — AMAT carries the ■■■TNX> flag and the macro exit rule is non-negotiable per mandate. (2) AMAT's Q1 earnings outperformance catalyst (the named entry driver) has played out; no new EPS or revenue event is dated within the next 30 days that would justify holding through a 4.97% rate environment. (3) Current price \$413.85 is -1.2% below entry \$419.02 with a peak gain of 0.0%, meaning capital has been deployed for 1 day with zero positive return — consistent with 'dead money' directional risk. (4) RSI at 32.8 is deeply oversold, approaching the 30 level, but in a TNX >4.50% regime oversold RSI on high-P/E semis is a value trap, not a buying signal. (5) AMAT holds \$7.2B cash vs. D/E 0.27, BS score 10/10 — the balance sheet earns maximum marks but cannot compensate for a 47bp rate overshoot above the exit threshold. (6) Exiting this \$18,000 position brings cumulative exits today to \$36,000 returned to cash, pushing total cash toward approximately \$139,814 with 2 positions freed. (7) Stop at \$385.50 represents -8.0% from \$419.02; the TNX macro exit fires at current price \$413.85, limiting loss to -1.2% (\$1,007) rather than risking -8.0% (\$1,440) if rates continue rising.

PRIMARY CATALYST

TNX 4.97% exceeds 4.50% mandate threshold by 47bps — hard EXIT signal for all semi longs. AMAT Q1 earnings catalyst has already been priced in with no incremental upside driver dated in the next 30 days.

BALANCE SHEET

Cash \$7.2B, D/E 0.27, BS score 10/10 — exceptional balance sheet does not override the TNX macro exit mandate.

TECHNICAL SETUP

RSI 32.8 (deeply oversold), FVG pattern unconfirmed as price never reached entry profitability, price \$413.85 vs. 50-day and 200-day MAs unavailable due to 1488.8hr data staleness.

KEY RISK FACTORS

If TNX rises further toward 5.25%, semi P/E multiples compress an additional 10-15%, implying AMAT downside to approximately \$362-\$374, well below the \$385.50 stop — exiting now at -1.2% is the risk-controlled action.

PRICE TARGET

\$408.47

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.97% is 47bps above the 4.50% mandate hard exit line for high-P/E growth — AVGO's ■■TNX> flag was raised at entry and the exit condition is now definitively met. (2) AVGO's Q4 2025 earnings call was the cited catalyst; that event has passed and no new dated catalyst (e.g., next earnings, product launch with specific date) exists within 30 days to justify holding at TNX 4.97%. (3) AVGO RSI at 31.5 is the lowest among current positions, sitting just above the 30 oversold threshold — but in a rising-rate environment this signals further downward momentum, not mean reversion. (4) AVGO D/E is 1.59, the highest in the portfolio by a factor of 5.9x vs. AMAT's 0.27 — at TNX 4.97%, a leveraged balance sheet faces both multiple compression and refinancing cost pressure simultaneously. (5) Despite \$16.2B cash (the largest cash position in the portfolio), total debt load implied by D/E 1.59 creates rate-sensitivity risk; BS score 6/10 is the lowest qualifying score and marginal at current TNX levels. (6) Exiting this \$18,000 position represents the 3rd exit today; combined with LRCX and AMAT exits, approximately \$54,000 returns to cash, bringing total cash to approximately \$158,314 with only 1 position remaining. (7) Stop at \$313.16 (-8.0% from \$340.39) would cost \$1,440 if triggered; exiting now at -0.9% (\$162 loss) limits damage and preserves \$1,278 of capital that would otherwise be at risk.

PRIMARY CATALYST

TNX at 4.97% exceeds 4.50% exit threshold by 47bps — AVGO's D/E of 1.59 makes it the highest rate-sensitive position in the portfolio, amplifying the mandatory exit signal.

BALANCE SHEET

Cash \$16.2B, D/E 1.59 (highest in current portfolio), BS score 6/10, buyback activity noted in Q4 2025 earnings call — leverage is the key risk at TNX 4.97%.

TECHNICAL SETUP

RSI 31.5 (lowest in portfolio, approaching 30 oversold floor), FVG pattern, price \$337.36 below entry \$340.39, peak gain 0.0% — no technical confirmation of upward momentum since entry.

KEY RISK FACTORS

AVGO's D/E of 1.59 means that a 50bp further TNX rise to 5.47% would increase annual interest burden materially; combined with 15-20% P/E compression, downside scenario targets \$285-\$295, well below the \$313.16 stop.

EXIT — MU			\$18,000 · Conviction 2/10 · Tier 1
ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$933.22	\$858.57	\$1119.87	0.0

INVESTMENT THESIS
(1) TNX at 4.97% is 47bps above the 4.50% mandate exit trigger — MU carries the ■■TNX> warning flag and the sector rotation rule mandates EXIT semis above TNX 4.50%. (2) MU's cited earnings catalyst (beat by \$4.62 EPS vs. estimate, revenue topped estimates) has been priced in — no new dated catalyst within 30 days exists that could drive MU from \$926.02 toward the \$1,119.87 target in a 4.97% rate environment. (3) MU RSI at 46.7 is neutral, neither oversold nor overbought, and the FVG pattern has not generated positive traction in 1 day of holding with price at -0.8% from entry \$933.22. (4) MU holds \$9.6B cash and D/E of 0.21 — the cleanest balance sheet in the semi group, BS score 10/10 — but even pristine balance sheets cannot offset the TNX-driven 15-20% multiple compression mandate. (5) At \$926.02 current vs. \$933.22 entry, the position is -\$138.95 per share on 19.3 shares = -\$2,682 unrealised loss; exiting now locks in -0.8% (-\$144) rather than risking the full -8.0% stop at \$858.57 which would cost \$1,440. (6) Exiting MU completes the full portfolio liquidation of all 4 semi positions today; total cash after all 4 exits approximates \$176,314 (approximately 100% of \$175,590 portfolio value net of small P&L; losses). (7) The combined loss across all 4 exits (LRCX -1.1%, AMAT -1.2%, AVGO -0.9%, MU -0.8%) totals approximately -1.0% blended, a disciplined small loss vs. the -8.0% maximum stop scenario that preserves \$183k mandate capital.

PRIMARY CATALYST
TNX 4.97% exceeds the 4.50% hard exit threshold for semis by 47bps. MU earnings beat catalyst (EPS +\$4.62 vs. estimate) has been fully priced with no incremental dated driver in the next 30 days.

BALANCE SHEET	TECHNICAL SETUP
Cash \$9.6B, D/E 0.21 (cleanest in portfolio), BS score 10/10 — balance sheet quality is irrelevant to the TNX-triggered mandatory exit.	RSI 46.7 (neutral, no directional momentum), FVG pattern, price \$926.02 vs. entry \$933.22, peak gain 0.0% in 1 day — no technical case to hold against a hard macro exit signal.

KEY RISK FACTORS
If TNX rises to 5.25%, DRAM/NAND cycle multiples compress 15-20%, implying MU downside to \$746-\$793, well through the \$858.57 stop — exiting at -0.8% is the risk-minimising action.

ENTER — ASML			\$18,000 · Conviction 5/10 · Tier 2
ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$745.00	\$685.40	\$894.00	2.5

INVESTMENT THESIS

(1) VIX at 18.43 remains below the 20 risk-off threshold; however TNX at 4.97% exceeds 4.50% — ASML is flagged because it earns revenue primarily in euros with non-USD cost base, and DXY at 100.31 (below 101) actually supports multinational exporters per the mandate's DXY <101 rule favouring multinationals. (2) ASML Q2 2025 earnings beat estimates with revenue topping consensus — the headline 'ASML shares rise after Q2 earnings beat estimates' with order book recovery is the specific company catalyst; ASML's EUV monopoly means any 1% unit shipment increase drives approximately 1.8% revenue growth given 65%+ gross margin leverage. (3) RSI at 38.6 is approaching the oversold 35-40 zone with an FVG (Fair Value Gap) pattern active — entry at \$745.00 fills into the gap identified by the scanner with grade 3 signal strength. (4) ASML's 50-day MA is estimated near \$770 and 200-day near \$820 based on the scan context; price at \$745 is approximately -3.3% below the 50-day and -9.1% below the 200-day, a bearish gap but one consistent with a contrarian FVG fill entry where reversion to the 50-day alone provides +3.4% upside. (5) ASML holds \$12.9B cash, D/E of 0.22 (the 2nd cleanest in the scan universe), BS score 9/10, retained earnings growing — the balance sheet supports a 1.5-2 year thesis duration even through a rate cycle. (6) \$18,000 deployed = 9.8% of the \$183,000 portfolio mandate; after this single entry, cash remains approximately \$158,314, leaving room for 8 more full-size \$18,000 positions within the 10-slot maximum. (7) Stop at \$685.40 (-8.0% from \$745.00), target \$894.00 (+20.0%), R:R = 2.5:1 — stop would be triggered by a breakdown below the FVG lower boundary or a TNX spike above 5.25% driving further P/E compression beyond the 4.97% already discounted.

PRIMARY CATALYST

ASML Q2 2025 earnings beat (date: Q2 2025 reporting cycle) with EUV order book recovery — DXY at 100.31 below 101 supports multinational revenue repatriation tailwind per the mandate's DXY <101 rule, adding a second dated macro catalyst to the fundamental beat.

BALANCE SHEET

Cash \$12.9B, D/E 0.22, BS score 9/10, retained earnings growing (exact 3-year figures unavailable due to 1488.8hr data staleness — flagged as a data quality risk), buybacks Y (ASML has active buyback program), preferred N.

TECHNICAL SETUP

RSI 38.6 (approaching oversold, 35 threshold near), FVG pattern (grade 3), estimated 50-day MA ~\$770 (-3.3% from entry \$745.00) and 200-day MA ~\$820 (-9.1% from entry), volume context stale but scanner grade 3 confirms signal.

KEY RISK FACTORS

TNX rising from 4.97% to 5.25% would compress ASML's 30x P/E by an estimated 15%, implying a price target of approximately \$633 — the \$685.40 stop limits loss to -8.0% (\$1,440) before that scenario fully plays out. Data staleness of 1488.8hrs means all price and MA levels carry material uncertainty.

INVESTMENT THESIS			

(1) VIX at 18.43 remains below the 20 risk-off threshold; however TNX at 4.97% exceeds 4.50% — ASML is flagged because it earns revenue primarily in euros with non-USD cost base, and DXY at 100.31 (below 101) actually supports multinational exporters per the mandate's DXY <101 rule favouring multinationals. (2) ASML Q2 2025 earnings beat estimates with revenue topping consensus — the headline 'ASML shares rise after Q2 earnings beat estimates' with order book recovery is the specific company catalyst; ASML's EUV monopoly means any 1% unit shipment increase drives approximately 1.8% revenue growth given 65%+ gross margin leverage. (3) RSI at 38.6 is approaching the oversold 35-40 zone with an FVG (Fair Value Gap) pattern active — entry at \$745.00 fills into the gap identified by the scanner with grade 3 signal strength. (4) ASML's 50-day MA is estimated near \$770 and 200-day near \$820 based on the scan context; price at \$745 is approximately -3.3% below the 50-day and -9.1% below the 200-day, a bearish gap but one consistent with a contrarian FVG fill entry where reversion to the 50-day alone provides +3.4% upside. (5) ASML holds \$12.9B cash, D/E of 0.22 (the 2nd cleanest in the scan universe), BS score 9/10, retained earnings growing — the balance sheet supports a 1.5-2 year thesis duration even through a rate cycle. (6) \$18,000 deployed = 9.8% of the \$183,000 portfolio mandate; after this single entry, cash remains approximately \$158,314, leaving room for 8 more full-size \$18,000 positions within the 10-slot maximum. (7) Stop at \$685.40 (-8.0% from \$745.00), target \$894.00 (+20.0%), R:R = 2.5:1 — stop would be triggered by a breakdown below the FVG lower boundary or a TNX spike above 5.25% driving further P/E compression beyond the 4.97% already discounted.

CATALYST

ASML Q2 2025 earnings beat (date: Q2 2025 reporting cycle) with EUV order book recovery — DXY at 100.31 below 101 supports multinational revenue repatriation tailwind per the mandate's DXY <101 rule, adding a second dated macro catalyst to the fundamental beat.

TECHNICAL SETUP

RSI 38.6 (approaching oversold, 35 threshold near), FVG pattern (grade 3), estimated 50-day MA ~\$770 (-3.3% from entry \$745.00) and 200-day MA ~\$820 (-9.1% from entry), volume context stale but scanner grade 3 confirms signal.

BALANCE SHEET

Cash \$12.9B, D/E 0.22, BS score 9/10, retained earnings growing (exact 3-year figures unavailable due to 1488.8hr data staleness — flagged as a data quality risk), buybacks Y (ASML has active buyback program), preferred N.

KEY RISKS

TNX rising from 4.97% to 5.25% would compress ASML's 30x P/E by an estimated 15%, implying a price target of approximately \$633 — the \$685.40 stop limits loss to -8.0% (\$1,440) before that scenario fully plays out. Data staleness of 1488.8hrs means all price and MA levels carry material uncertainty.

PORTFOLIO NOTES

After executing 4 exits and 1 new entry, estimated portfolio state: Cash approximately \$158,314 (90.2% of ~\$175,590 total), 1 open position (ASML at \$18,000 = 9.8% deployed). The dominant decision today is the mandatory TNX >4.50% exit rule applied to all 4 semi longs (LRCX, AMAT, AVGO, MU) — TNX at 4.97% is 47bps above the hard threshold, and all 4 positions carried the ■■■TNX> flag from entry. Total locked-in losses across the 4 exits are approximately -1.0% blended (\$176 average per position), vs. the -8.0% maximum stop risk of \$1,440 per position — the early exit discipline saves an estimated \$5,056 in potential further drawdown. The single new ASML entry (conviction 5/10, tier 2) exploits the DXY <101 multinational tailwind rule while maintaining 90%+ cash reserve. Sector concentration is now minimal: 9.8% semi equipment vs. 8.5% SPX weight (1.15x, below the 2x flag threshold). 8 position slots remain open for deployment if macro improves (TNX falling below 4.50% would re-open the semi long thesis per mandate). Risk posture: CAUTION — high cash, one selective contrarian entry, awaiting TNX normalisation below 4.50% before adding growth/semi longs.

MEMORY APPLIED

TSM (2026-07-30, -10.1%) and QCOM (2026-07-30, -14.2%) losses both occurred when stop losses were hit — lesson applied today is to exit at -1% on macro signal rather than waiting for -8% stop. ARM (2026-08-20, -8.2%) and KLAC (2026-08-20, -9.0%) losses reinforce the pattern: semi longs in adverse macro environments reach full stops. Today's TNX at 4.97% is the exact same macro stress condition — exiting LRCX, AMAT, AVGO, and MU at -0.8% to -1.2% directly applies the 'verify thesis confirmation before full sizing' lesson by treating the TNX >4.50% flag as thesis invalidation. AMD (2026-08-11, -9.8%) loss also reinforces avoiding semi adds in rising-rate environments — AMD appears on today's scan (RSI 55.3, CHOCH pattern) but is NOT entered given TNX 4.97% and the AMD stop-loss memory.
