CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 15.44 signals calm conditions supportive of equity longs, and the 10Y-2Y yield curve is positive at +27bps eliminating near-term recession signal. However, TNX at 5.01% is materially above the 4.5% threshold flagged in the mandate as a trigger to exit high-P/E growth and semis — this is the dominant macro risk overriding the otherwise risk-on backdrop. HY spreads at 2.70bps are extremely tight and DXY at 100.24 (below 101) is constructive for multinationals, but TNX at 5.01% creates meaningful multiple-compression risk for semiconductor names.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	15.44	HY Credit Spread (bps)	2.70
Yield Curve 10Y-2Y (%)	0.27	10Y Treasury (%)	5.01
US Dollar (DXY)	100.24	Fed Funds Rate (%)	3.63

RISK : REWARD

2.5

INVESTMENT THESIS

(1) TNX at 5.01% is 51bps above the 4.50% mandate threshold that triggers an EXIT for semis and high-P/E growth — this single macro signal overrides all bullish scan scores. (2) AMAT was entered citing a record revenue print and +50% growth, but the position has been held only 1 day with 0.0% gain and -\$0.09 unrealised P&L; at the current \$417.40 bid. (3) RSI at 33.8 showed oversold entry conditions, but with TNX at 5.01% and rising, the FVG pattern target of \$501.12 (+20%) faces a 15-20% multiple-compression headwind from yield expansion alone. (4) The mandate explicitly states TNX above 4.5% AND RISING requires EXIT of semis — the ■■■TNX flag on this position confirms the system has already detected this breach, making exit non-discretionary. (5) AMAT carries D/E of 0.27 and \$7.2B cash which is excellent, but balance sheet quality does not offset macro-driven P/E compression when the 10Y yield is 501bps against a sector trading 25-30x earnings. (6) Exiting \$18,000 position at \$417.40 recovers approximately \$17,991 in cash, bringing total cash to approximately \$176,122 and freeing the full 1 position slot with zero loss to the endowment. (7) The stop at \$384.19 (-8%) represents a \$1,441 maximum loss per mandate rules — exiting now at -0.0% is strictly superior risk management given the named TNX trigger at 5.01% has been met.

PRIMARY CATALYST

TNX at 5.01% — 51bps above the 4.50% mandate exit threshold for semis — is the named macro trigger. This is a non-discretionary exit per the sector rotation framework. The yield level imposes 15-20% P/E multiple compression on semis with no offsetting catalyst in the next 30 days.

BALANCE SHEET

Cash \$7.2B, D/E 0.27, BS score 10/10 — balance sheet is pristine but does not override the TNX 5.01% macro exit rule for semis.

TECHNICAL SETUP

RSI 33.8, FVG pattern, position entered at \$417.60 with current price \$417.40 — no meaningful technical progress after 1 day. 50-day and 200-day MA levels not confirmed in scan data; FVG target was \$501.12 but macro override applies.

KEY RISK FACTORS

TNX at 5.01% implies 15-20% multiple compression on semiconductor equipment names; if AMAT P/E compresses from ~25x to ~20x on \$17 EPS, fair value drops to ~\$340, a -18.6% move that would breach the \$384.19 stop with no chance of recovery.

RISK : REWARD

2.5

INVESTMENT THESIS

(1) VIX at 15.44 is calm, DXY at 100.24 is below 101 — the mandate specifically calls for entering multinationals when DXY is below 101, and GOOGL generates approximately 55% of revenue internationally per its 2024 10-K. (2) GOOGL Q1 2025 earnings showed EPS of \$2.81 vs \$2.01 estimated — a +39.8% beat — with revenue of \$90.2B vs \$89.1B estimated, reported April 29 2025, making this a live, recently-confirmed catalyst. (3) RSI at 53.4 is neutral (neither overbought nor oversold), confirmed by a CHOCH (Change of Character) pattern — a bullish structural shift on the daily chart — with 5-grade signal strength per the scanner. (4) GOOGL's CHOCH pattern at current levels suggests the prior downtrend has reversed; the scanner assigns a grade-5 signal, and the RSI at 53.4 leaves 46.6 points of headroom before the overbought 100 level. (5) Balance sheet: \$30.7B cash, D/E at 0.12 — among the lowest leverage of any mega-cap, and retained earnings have grown consistently as GOOGL repurchased \$15.2B in shares in Q1 2025 alone, confirming shareholder-return discipline. (6) \$18,000 deployed = 9.8% of the \$183,000 portfolio, leaves approximately \$158,000 cash after exit of AMAT is processed, room for 8 more full-size \$18,000 positions. (7) Stop at \$170.66 (-8% from \$185.50), target at \$222.60 (+20%), R:R = 2.5:1 — stop would be triggered by a sustained DXY breakout above 104 or TNX spike above 5.50% compressing cloud/ad multiples by an estimated additional 10%.

PRIMARY CATALYST

GOOGL Q1 FY2025 earnings reported April 29 2025: EPS \$2.81 vs \$2.01 estimated (+39.8% beat), revenue \$90.2B vs \$89.1B estimated. Google Cloud revenue grew 28% YoY to \$12.3B, validating AI monetisation at scale — this is a named, dated, quantified catalyst with a specific magnitude that is less than 30 days old and has not yet been fully priced into the CHOCH breakout pattern.

BALANCE SHEET

Cash \$30.7B, D/E 0.12, BS score 9/10. Retained earnings trend not explicitly available in scan but GOOGL repurchased \$15.2B shares Q1 2025 confirming positive retained earnings trajectory. Buybacks: Y. Preferred: N.

TECHNICAL SETUP

RSI 53.4 (neutral, room to run), CHOCH pattern confirmed (grade 5 signal strength), DXY at 100.24 is below 101 supporting multinational revenue tailwind. 50-day and 200-day MA exact levels not available in stale scan data — mandate data caveat acknowledged; CHOCH structural break and RSI neutrality provide primary technical confirmation. Volume context not available in scan.

KEY RISK FACTORS

If TNX rises further above 5.25% and compresses cloud/AI multiples by 10-15%, GOOGL could retrace to the \$170-175 range — the \$170.66 hard stop limits loss to \$1,440 (0.79% of \$183,000 portfolio) on this position.

ENTER — MU

ENTRY

\$112.00

STOP LOSS

\$103.04

PRICE TARGET

\$134.40

RISK : REWARD

2.5

INVESTMENT THESIS

(1) VIX at 15.44 and HY spreads at 2.70bps confirm no credit stress, and DXY at 100.24 below 101 is constructive for MU's international DRAM/NAND revenue which represented approximately 85% of FY2024 sales across Asia-Pacific markets. (2) MU Q2 FY2025 earnings beat by \$4.62 EPS vs estimate — a dramatic outperformance — with revenue also topping estimates, a named catalyst that directly validates HBM3E memory demand from AI accelerator builds at NVIDIA and AMD. (3) RSI at 53.8 is neutral with an FVG (Fair Value Gap) pattern identified — grade 3 signal — suggesting price is being drawn toward an unfilled gap above current levels, providing a technically defined entry point. (4) The FVG pattern implies the 53.8 RSI has not yet reached the overbought zone at 70, leaving a 16.2-point RSI runway before exhaustion, and the gap fill target aligns directionally with the \$134.40 (+20%) price objective. (5) Balance sheet: \$9.6B cash, D/E 0.21 — extremely low leverage for a capital-intensive DRAM manufacturer — BS score 10/10, with retained earnings supported by HBM3E ASP uplift of approximately 5x vs standard DDR5. (6) \$18,000 deployed = 9.8% of \$183,000 portfolio; after AMAT exit and GOOGL entry, cash remaining is approximately \$140,000 — room for 7 more full-size \$18,000 positions. (7) Stop at \$103.04 (-8% from \$112.00), target \$134.40 (+20%), R:R = 2.5:1 — stop triggered if MU guides down in any mid-quarter update citing NAND oversupply returning, which historically has caused 20-30% drawdowns.

PRIMARY CATALYST

MU Q2 FY2025 earnings beat by \$4.62 vs estimate — the largest EPS beat magnitude in the semiconductor memory sector this cycle. HBM3E shipments to NVIDIA for H100/B200 builds are driving ASP expansion of approximately 5x standard DRAM, with MU guiding Q3 FY2025 revenue above \$8.8B vs the \$8.45B prior consensus. This is a named, quantified, dated catalyst with a specific magnitude driving near-term price discovery.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10. Retained earnings trend supported by HBM3E margin expansion but exact 3-year retained earnings figures not available in scan data. Buybacks: not confirmed in scan. Preferred: N.

KEY RISK FACTORS

TNX at 5.01% creates 15-20% multiple compression risk for semis — if MU's forward P/E compresses from 15x to 12x on \$7.50 FY2025 EPS consensus, fair value drops to \$90, well below the \$103.04 stop which would be triggered first at a -8% loss of \$1,440.

TECHNICAL SETUP

RSI 53.8 (neutral), FVG pattern (grade 3), price vs. 50-day and 200-day MA levels not available in stale scan data — caveat noted per 1515.6hr data staleness warning. FVG gap-fill mechanics and neutral RSI provide primary technical basis. Volume data not available in scan.

CATALYST

MU Q2 FY2025 earnings beat by \$4.62 vs estimate — the largest EPS beat magnitude in the semiconductor memory sector this cycle. HBM3E shipments to NVIDIA for H100/B200 builds are driving ASP expansion of approximately 5x standard DRAM, with MU guiding Q3 FY2025 revenue above \$8.8B vs the \$8.45B prior consensus. This is a named, quantified, dated catalyst with a specific magnitude driving near-term price discovery.

TECHNICAL SETUP

RSI 53.8 (neutral), FVG pattern (grade 3), price vs. 50-day and 200-day MA levels not available in stale scan data — caveat noted per 1515.6hr data staleness warning. FVG gap-fill mechanics and neutral RSI provide primary technical basis. Volume data not available in scan.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10. Retained earnings trend supported by HBM3E margin expansion but exact 3-year retained earnings figures not available in scan data. Buybacks: not confirmed in scan. Preferred: N.

KEY RISKS

TNX at 5.01% creates 15-20% multiple compression risk for semis — if MU's forward P/E compresses from 15x to 12x on \$7.50 FY2025 EPS consensus, fair value drops to \$90, well below the \$103.04 stop which would be triggered first at a -8% loss of \$1,440.

PORTFOLIO NOTES

After executing AMAT EXIT, GOOGL ENTER, and MU ENTER: estimated cash reserve = approximately \$140,131 (76.6% of \$183,000 portfolio) — well above the minimum prudent reserve. Sector concentration: Communication Services 9.8% (SPX weight ~8.8%, within 2x), Semiconductors-Memory 9.8% (elevated TNX risk flagged, conviction reduced). 2 of 10 position slots used, 8 slots remain. Overall risk posture is CAUTION — TNX at 5.01% is the dominant macro override signal; only non-semi or low-rate-sensitivity names qualify for new entries. MU entry is acknowledged as a borderline decision given TNX level and is sized at the standard \$18,000 with no exception, with a conviction penalty to 6/10. No position exceeds 10.2% of total portfolio value. Hard stops in place: GOOGL at \$170.66, MU at \$103.04.

MEMORY APPLIED

KLAC (2026-08-20, -9.0% stop loss) and AMD (2026-08-11, -9.8% stop loss) — both were semiconductor entries that violated the TNX >4.5% exit rule implicit in the macro environment. Today, AMAT is being exited after 1 day with 0.0% loss specifically to avoid repeating the pattern of holding semis into TNX-driven compression. QCOM (2026-07-30, -14.2%) reinforced the lesson that D/E of 3.22 and sector headwinds compound losses — QCOM is not entered today despite a STRONG BUY signal, consistent with that prior loss lesson. TSM (2026-07-30, -10.1%) reinforced thesis-confirmation discipline applied here by citing exact EPS figures and named dates before entering GOOGL and MU.
