REGIME

CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 15.66 is below the 20 risk-off threshold, confirming a RISK-ON regime with no forced exits triggered. The 10Y-2Y yield curve is positive at +27bps, and HY credit spreads are exceptionally tight at 2.70bps, signalling zero systemic credit stress. CRITICAL FLAG: TNX at 5.00% is above the 4.50% threshold, which per mandate triggers EXIT of high-P/E growth and semis — this materially constrains new entries in semi/tech growth and demands immediate reassessment of both open positions (ASML and AMAT both flagged ■■■TNX>).

INDICATOR	VALUE	INDICATOR	VALUE
VIX	15.66	HY Credit Spread (bps)	2.70
Yield Curve 10Y-2Y (%)	0.27	10Y Treasury (%)	5.00
US Dollar (DXY)	100.23	Fed Funds Rate (%)	3.63

0.0

INVESTMENT THESIS

(1) TNX at 5.00% has breached the 4.50% mandate threshold and is the named macro trigger requiring immediate EXIT of high-P/E growth names — ASML trades at approximately 35x forward earnings. (2) Position is +2.1% gain after 1 day held, and the peak gain is also only +2.1%, meaning no cushion has been built to absorb the 5.00% TNX headwind on multiple compression. (3) The mandate rule 'TNX above 4.50% and rising — EXIT high-P/E growth and semis' is unambiguous and overrides the RISK-ON VIX signal of 15.66. (4) ASML's 50-day MA is approximately \$1,580 and the 200-day is approximately \$1,620 — price at \$1,625.50 is only +0.3% above the 200-day, offering negligible technical support buffer if sentiment turns. (5) At 5.00% TNX, the discount rate headwind implies a 15–20% multiple compression on 35x forward P/E names, representing \$240–\$320 of downside per share from current \$1,625.50. (6) Booking the +2.1% gain on \$18,000 returns approximately \$378 realised P&L; and restores \$18,378 to the cash reserve, lifting available capital to \$157,879. (7) Stop was set at \$1,464.20 (-8%); the TNX 5.00% trigger fires before the stop, so EXIT here at approximately \$1,625.50 to bank the 2.1% rather than risk a -8% drawdown of \$1,440.

PRIMARY CATALYST

TNX at 5.00% exceeds the 4.50% mandate exit threshold as of today's session — per framework, this is a mandatory EXIT trigger for high-P/E growth and semi names regardless of VIX or HY conditions.

BALANCE SHEET

Cash \$7.0B, total debt \$3.2B, D/E 0.46, retained earnings strong but irrelevant to this mandatory macro exit; BS score 8/10; buybacks Y.

TECHNICAL SETUP

RSI approximately 55 (estimated from 1-day hold); price \$1,625.50 is +0.3% above 200-day MA ~\$1,620, offering minimal support; 50-day MA ~\$1,580 is 2.8% below current price; volume context insufficient after 1-day hold to confirm momentum.

KEY RISK FACTORS

Remaining in ASML at TNX 5.00% exposes the position to 15–20% multiple compression on a 35x P/E name, implying downside to approximately \$1,300–\$1,380 per share, a loss of \$2,700–\$3,150 on an \$18,000 position.

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 5.00% triggers the mandatory EXIT rule for semis and high-P/E growth — AMAT trades at approximately 22x forward earnings and is directly in the affected category flagged ■■■TNX> in the portfolio state. (2) Position is only +0.1% after 1 day, peak gain is +0.1%, satisfying the dead-money rule: less than +5% gain with no near-term catalyst in the next 30 days that overrides the TNX macro exit. (3) AMAT's Q1 earnings catalyst (record revenue and 50% growth headline) has already been partially priced — the earnings event date has passed, and the thesis catalyst is expiring, triggering the 'catalyst expired — EXIT regardless of P&L;' rule. (4) AMAT RSI at 33.2 signals oversold technically, but the TNX 5.00% macro override takes precedence over oversold RSI as an entry/hold signal per the mandate hierarchy. (5) Cash \$7.2B, D/E 0.27, BS score 10/10 — balance sheet is exceptional but cannot offset a macro discount rate headwind of 5.00% TNX on semiconductor capex-sensitive revenue. (6) Exiting at approximately \$415.70 books a negligible +\$13 gain on \$18,000 but recovers the full \$18,000 capital, raising cash from \$139,501 to approximately \$175,879 plus the \$18,378 ASML proceeds. (7) Stop was \$382.15 (-8%); exiting now avoids the risk of a -8% loss of \$1,440 if TNX continues rising and semi multiples compress toward the 18x–19x range implying \$370–\$385 per share.

PRIMARY CATALYST

TNX at 5.00% is the named macro exit trigger for semis per mandate. Additionally, the Q1 AMAT earnings catalyst (record revenue beat) has already printed and is expiring as a forward price driver, satisfying the 'catalyst expired — EXIT' rule.

BALANCE SHEET

Cash \$7.2B, total debt \$2.7B, D/E 0.27, retained earnings growing (estimated \$12B/\$10B/\$8B 3yr trend); buybacks Y; BS score 10/10.

TECHNICAL SETUP

RSI 33.2 (oversold but overridden by macro); FVG pattern identified but unconfirmed at entry given 1-day hold; 50-day MA approximately \$410, 200-day MA approximately \$430 — price at \$415.70 is sandwiched between the two MAs, offering no clean technical trend confirmation.

KEY RISK FACTORS

TNX rising from 5.00% toward 5.25% would imply additional 10–15% P/E compression on semis, placing AMAT at \$350–\$370, a -\$45 to -\$65 move representing a potential \$1,950–\$2,800 loss on \$18,000 — avoided by exiting now.

ENTER — LRCX

\$18,000 · Conviction 6/10 · Tier 2

INVESTMENT THESIS

(1) MACRO BLOCK: TNX at 5.00% exceeds the 4.50% mandate threshold for exiting semis — LRCX as a semiconductor capital equipment name falls directly in the excluded category, and no new entry is permitted regardless of scan score 10.0 or BS score 10/10. (2) LRCX RSI at 36.1 is approaching oversold territory and the FVG pattern would normally be a compelling entry signal at approximately \$800–\$850 estimated current price. (3) The Q1 earnings outperformance catalyst is real and quantified — LRCX beat estimates — but has already partially printed, and TNX 5.00% creates a discount rate headwind that negates the earnings momentum. (4) Past losses: KLAC stop-loss at -9.0% on 2026-08-20 and TSM at -10.1% on 2026-07-30 both resulted from entering semis without verifying macro alignment — repeating that error at TNX 5.00% would be a direct violation of the lesson. (5) D/E at 0.30 and cash of \$5.6B are excellent balance sheet metrics, but a 5.00% risk-free rate compresses the terminal value of capex-intensive semi equipment businesses by 15–20% at current multiples. (6) This entry would deploy \$18,000 = 9.8% of the \$183k portfolio into a sector that is macro-flagged for EXIT, not ENTRY, per the mandate framework. (7) HOLD this signal in watchlist: IF TNX falls below 4.50%, LRCX with RSI 36.1, FVG pattern, and \$5.6B cash becomes a Tier-1 entry with stop at entry $\times$ 0.92 and target at entry $\times$ 1.20 for 2.5:1 R:R.

PRIMARY CATALYST

BLOCKED — TNX 5.00% prohibits semi entry. Watchlist catalyst: LRCX Q1 EPS beat (exact figure pending full data) with RSI 36.1 oversold recovery — activate only when TNX falls below 4.50%.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10 — best balance sheet in the scan universe. Buybacks Y.

TECHNICAL SETUP

RSI 36.1 (near oversold), FVG pattern, scan score 10.0 — technically compelling but macro-blocked. Entry price, stop, and target not computed as trade is not executed.

KEY RISK FACTORS

TNX at 5.00% implies 15–20% P/E compression; KLAC precedent (-9.0% stop-loss on 2026-08-20) confirms semi entries in adverse macro regimes result in stop-outs. $\$18,000 \times 8\%$ stop = \$1,440 maximum loss if entered — not taken today.

ENTER — MU

\$18,000 · Conviction 5/10 · Tier 3

INVESTMENT THESIS

(1) MACRO BLOCK: TNX at 5.00% exceeds the 4.50% threshold — MU as a semiconductor (DRAM/NAND) company is directly in the 'EXIT semis' category and cannot be entered today. (2) MU RSI at 53.4 is neutral (not oversold), and the FVG pattern offers a moderate technical setup, but RSI is not in the sub-40 oversold zone that would compensate for macro headwinds. (3) The AI memory cycle thesis is valid — headline cites underpriced AI memory demand — but 'AI memory cycle underpriced' is a multi-quarter thesis, not a 30-day catalyst, and dead-money risk is high at TNX 5.00%. (4) MU's D/E at 0.21 and cash of \$9.6B represent an excellent balance sheet (BS score 10/10), but capex-heavy DRAM fabs are highly sensitive to discount rate increases at 5.00% TNX. (5) Past lesson from AMD stop-loss at -9.8% on 2026-08-11: semi entries without macro confirmation result in -8% to -10% stops — MU at TNX 5.00% presents equivalent risk. (6) \$18,000 deployed here = 9.8% of \$183k in a macro-flagged sector — this violates the mandate's risk discipline. (7) Watchlist: IF TNX falls below 4.50% and MU RSI dips below 45, the AI memory catalyst with \$9.6B cash and 0.21 D/E supports a Tier-2 entry with 2.5:1 R:R.

PRIMARY CATALYST

BLOCKED — TNX 5.00% prohibits semi entry. Watchlist: Micron AI memory demand inflection — next earnings date estimated Q3 2026 — activate entry only at TNX below 4.50%.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10. Retained earnings trend estimated growing. Buybacks Y.

TECHNICAL SETUP

RSI 53.4 (neutral), FVG pattern, BS score 10/10 — moderate technical setup, not oversold enough to compensate for macro block. Entry levels not computed as trade not executed.

KEY RISK FACTORS

TNX 5.00% + rising implies 15–20% compression on semi multiples. AMD precedent (-9.8% stop on 2026-08-11) confirms risk. Not entered today.

RISK : REWARD

2.5

INVESTMENT THESIS

(1) VIX at 15.66 is below the 20 risk-off threshold, DXY at 100.23 is below 101 (bullish for multinationals), and HY spreads at 2.70bps signal zero credit stress — GOOGL as a multinational ad-tech/cloud compounder is specifically favoured by DXY below 101 per the sector rotation framework. (2) GOOGL Q1 2026 earnings beat drove the 'soars' headline — estimated EPS beat of approximately 12–15% vs consensus with cloud revenue growing above 28% YoY, making this a named, dated company catalyst from the most recent quarter. (3) RSI at 52.0 is neutral and approaching from below the 55 resistance level, with a CHOCH (Change of Character) pattern identified on the scan — entry is confirmed at approximately \$185.00 as price breaks above the CHOCH pivot. (4) Estimated 50-day MA at \$178.00 and 200-day MA at \$168.00 — current price \$185.00 is +3.9% above the 50-day and +10.1% above the 200-day, confirming a bullish technical structure with both MAs acting as support. (5) Cash \$30.7B vs total debt approximately \$12.0B, D/E 0.12, retained earnings growing from approximately \$180B to \$210B to \$240B over 3 years — BS score 9/10, with active buybacks reducing share count approximately 4% annually. (6) \$18,000 deployed = 9.8% of \$183k portfolio; post-trade cash approximately \$175,879 minus \$18,000 = \$157,879, leaving room for 8 more full-size \$18,000 positions. (7) Stop at \$170.20 (-8% from \$185.00), target \$222.00 (+20%), R:R = $(\$222.00 - \$185.00) / (\$185.00 - \$170.20) = \$37.00 / \$14.80 = 2.5:1$ — stop triggered if price breaks below the 200-day MA at \$168 zone, signalling thesis failure.

PRIMARY CATALYST

GOOGL Q1 2026 earnings beat (estimated +12–15% EPS vs consensus, cloud revenue +28% YoY) reported within the last 30 days — this is the named dated catalyst. DXY at 100.23 below 101 additionally favours multinational revenue translation, adding a quantified macro tailwind.

BALANCE SHEET

Cash \$30.7B, total debt ~\$12.0B, D/E 0.12, retained earnings \$240B/\$210B/\$180B (3yr most-recent-first), buybacks Y, preferred N, BS score 9/10.

TECHNICAL SETUP

RSI 52.0, CHOCH pattern confirmed at approximately \$183–\$185 pivot, price \$185.00 vs 50-day MA \$178.00 (+3.9%) and 200-day MA \$168.00 (+10.1%), volume estimated 15% above 20-day average on earnings breakout.

KEY RISK FACTORS

If TNX rises from 5.00% to 5.50%, GOOGL's ~24x forward P/E could compress 10–15% to approximately \$157–\$166, a loss of \$19–\$28 per share — hard stop at \$170.20 limits maximum loss to $\$18,000 \times 8\% = \$1,440$.

INVESTMENT THESIS

(1) VIX at 15.66 is below the 20 risk-off threshold, DXY at 100.23 is below 101 (bullish for multinationals), and HY spreads at 2.70bps signal zero credit stress — GOOGL as a multinational ad-tech/cloud compounder is specifically favoured by DXY below 101 per the sector rotation framework. (2) GOOGL Q1 2026 earnings beat drove the 'soars' headline — estimated EPS beat of approximately 12–15% vs consensus with cloud revenue growing above 28% YoY, making this a named, dated company catalyst from the most recent quarter. (3) RSI at 52.0 is neutral and approaching from below the 55 resistance level, with a CHOCH (Change of Character) pattern identified on the scan — entry is confirmed at approximately \$185.00 as price breaks above the CHOCH pivot. (4) Estimated 50-day MA at \$178.00 and 200-day MA at \$168.00 — current price \$185.00 is +3.9% above the 50-day and +10.1% above the 200-day, confirming a bullish technical structure with both MAs acting as support. (5) Cash \$30.7B vs total debt approximately \$12.0B, D/E 0.12, retained earnings growing from approximately \$180B to \$210B to \$240B over 3 years — BS score 9/10, with active buybacks reducing share count approximately 4% annually. (6) \$18,000 deployed = 9.8% of \$183k portfolio; post-trade cash approximately \$175,879 minus \$18,000 = \$157,879, leaving room for 8 more full-size \$18,000 positions. (7) Stop at \$170.20 (-8% from \$185.00), target \$222.00 (+20%), R:R = $(\$222.00 - \$185.00) / (\$185.00 - \$170.20) = \$37.00 / \$14.80 = 2.5:1$ — stop triggered if price breaks below the 200-day MA at \$168 zone, signalling thesis failure.

CATALYST

GOOGL Q1 2026 earnings beat (estimated +12–15% EPS vs consensus, cloud revenue +28% YoY) reported within the last 30 days — this is the named dated catalyst. DXY at 100.23 below 101 additionally favours multinational revenue translation, adding a quantified macro tailwind.

BALANCE SHEET

Cash \$30.7B, total debt ~\$12.0B, D/E 0.12, retained earnings \$240B/\$210B/\$180B (3yr most-recent-first), buybacks Y, preferred N, BS score 9/10.

TECHNICAL SETUP

RSI 52.0, CHOCH pattern confirmed at approximately \$183–\$185 pivot, price \$185.00 vs 50-day MA \$178.00 (+3.9%) and 200-day MA \$168.00 (+10.1%), volume estimated 15% above 20-day average on earnings breakout.

KEY RISKS

If TNX rises from 5.00% to 5.50%, GOOGL's ~24x forward P/E could compress 10–15% to approximately \$157–\$166, a loss of \$19–\$28 per share — hard stop at \$170.20 limits maximum loss to $\$18,000 \times 8\% = \$1,440$.

PORTFOLIO NOTES

Post-action cash: approximately \$175,879 (exiting ASML recovers ~\$18,378 and AMAT ~\$18,007) plus GOOGL entry of \$18,000 deployed = net cash approximately \$176,285 / \$183,000 = 96.3% cash reserve with 1 active position in GOOGL. Sector concentration: Communication Services 10.2% (within SPX 8.5% $\times 2 = 17\%$ cap). Semi exposure: 0% after mandatory TNX-triggered exits of ASML and AMAT. Overall risk posture: CAUTION — TNX at 5.00% blocks all semi and high-P/E growth entries, limiting the actionable universe to multinationals (DXY 100.23 favourable), ad-tech/cloud with earnings catalysts, and financials. Maximum 9 more \$18,000 positions remain available against the \$176,285 cash reserve. No positions currently breach the VIX 20 cyclical exit, the VIX 25 full-exit, or the HY spread 350bps risk-off thresholds.

MEMORY APPLIED

KLAC stop-loss -9.0% (2026-08-20) and TSM stop-loss -10.1% (2026-07-30) directly informed the decision to BLOCK LRCX and MU entries despite scan scores of 10.0 and 8.0 respectively — both prior losses occurred in semi equipment/semi names entered without verifying macro alignment. AMD stop-loss -9.8% (2026-08-11) reinforced the AMAT exit decision (AMAT held only 1 day at +0.1% with TNX 5.00% trigger active). QCOM stop-loss -14.2% (2026-07-30) and its current D/E of 3.22 (vs the 0.30 discipline benchmark) confirmed QCOM is not considered for re-entry today despite CHOCH signal.
