CAUTION

MARKET ASSESSMENT

CAUTION

VIX at 16.40 signals a calm risk-on regime, yield curve positive at +41bps (10Y-2Y), and HY credit spreads at 3.12bps confirm healthy credit conditions — all three metrics are below their respective risk-off thresholds. However, TNX at 5.26% sits 76bps above the 4.5% mandate threshold where high-P/E growth and semis must be exited, creating a specific sector-rotation conflict for AMD and GOOGL currently held. DXY at 102.07 is below 104, leaving multinationals and commodity-linked names in favour, while the Fed Funds rate at 3.63% implies a 162bps real-rate premium over the 2% inflation anchor that continues to compress growth multiples.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	16.40	HY Credit Spread (bps)	3.12
Yield Curve 10Y-2Y (%)	0.41	10Y Treasury (%)	5.26
US Dollar (DXY)	102.07	Fed Funds Rate (%)	3.63

INVESTMENT THESIS

(1) TNX at 5.26% is 76bps above the 4.5% mandatory EXIT threshold for high-P/E growth and semis — the mandate is unambiguous on this trigger. (2) AMD was entered 1 day ago at \$616.95 and is currently at \$615.79, a -0.19% loss with peak gain of 0.0% — no gain has accrued to protect. (3) The original thesis cited VIX at 16.47 and DXY as supportive, but TNX overrides both per the sector-rotation framework — at 5.26% vs the 4.5% ceiling, the macro signal is at -17% relative threshold breach. (4) TRADE MEMORY: AMD stop-loss on 2026-08-11 at -9.8% confirms this name carries elevated stop-out risk when held through adverse macro conditions — repeating that loss on a \$18,000 position would cost approximately \$1,764. (5) Current P&L; is -\$33.92 on 29.2 shares at \$615.79 vs cost \$616.95 — exiting here limits loss to under 0.2% vs the 8.0% hard stop at \$567.59. (6) No near-term catalyst within 30 days has been identified to justify holding AMD above the TNX 4.5% threshold per the HOLD criteria requiring a specific named upcoming event with a date. (7) Exit at market ~\$615.79 recovers approximately \$17,981 in cash, reducing semi concentration and eliminating the -\$567.59 stop-loss exposure on this position.

PRIMARY CATALYST

TNX at 5.26% — 76bps above the 4.5% mandatory EXIT threshold for semis per the sector-rotation framework; no offsetting catalyst identified with a specific future date.

BALANCE SHEET

Exit decision — balance sheet not the driver; TNX macro override and trade memory of -9.8% AMD stop-loss on 2026-08-11 are the primary factors.

TECHNICAL SETUP

RSI N/A for exit decision — macro override takes precedence at TNX 5.26% vs 4.5% threshold; position held only 1 day with 0.0% peak gain.

KEY RISK FACTORS

Remaining in AMD with TNX at 5.26% exposes the \$17,966 position to a potential -8% stop-loss loss of approximately \$1,437 at \$567.59 — trade memory confirms AMD has already triggered this stop once on 2026-08-11.

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 5.26% is 76bps above the 4.5% mandatory EXIT threshold — GOOGL as a high-P/E growth name falls squarely within the exit mandate for this regime. (2) GOOGL was entered 1 day ago at \$338.49 and trades at \$339.26, a gain of +0.23% — peak gain is only +0.2% with no meaningful profit to protect via a trailing approach. (3) The 53.2 share position at \$339.26 represents \$18,049 in market value; exiting here locks in a gain of approximately +\$41 vs risking exposure to a -8.0% drawdown to the \$311.41 stop. (4) No specific upcoming catalyst with a named date has been identified for GOOGL in the next 30 days that would justify holding a growth name through a TNX environment 76bps above the exit threshold. (5) DXY at 102.07 is supportive for multinationals generally, but the TNX constraint at 5.26% overrides the DXY tailwind — the mandate hierarchy places TNX > DXY in this regime. (6) Exiting at ~\$339.26 recovers approximately \$18,049, pushing total cash to approximately \$128,158 (70.0% of \$183k portfolio), providing capacity for 6 additional \$18,000 positions when TNX normalises below 4.5%. (7) Stop at \$311.41 (-8.0%) would represent a \$1,444 loss on this position — the gain of +\$41 is minimal but the exit eliminates \$1,444 of downside risk in an adverse TNX environment.

PRIMARY CATALYST

TNX at 5.26% — 76bps above the 4.5% mandatory EXIT threshold for high-P/E growth names; no named future catalyst with a specific date identified to justify holding.

BALANCE SHEET

Exit decision — GOOGL balance sheet is strong but irrelevant to this exit; the TNX 5.26% macro override is the sole driver.

TECHNICAL SETUP

RSI not the exit driver — TNX macro override at 5.26% vs 4.5% threshold takes precedence; position held 1 day with peak gain of only +0.2%.

KEY RISK FACTORS

Holding GOOGL at TNX 5.26% exposes the position to multiple-compression risk; at -8.0%, the \$311.41 stop implies a \$1,444 maximum loss on this \$18,049 position.

INVESTMENT THESIS

(1) CAUTION: TNX at 5.26% is 76bps above the 4.5% mandatory EXIT threshold for semis — this is a direct sector-rotation conflict for LRCX as a semiconductor equipment name, and despite a BS score of 10/10 and CHOCH pattern, the TNX override makes this entry non-compliant with the mandate today. (2) LRCX Q2 2026 Earnings Call highlighted in the scanner represents a potential catalyst, but without an exact EPS figure vs estimate and beat percentage confirmed, Checklist Item 2 cannot be satisfied with a specific number as required. (3) RSI at 64.7 is approaching overbought territory (threshold 70), and CHOCH (Change of Character) pattern with a grade of 5 is technically constructive, but the 50-day MA and 200-day MA prices are unavailable due to scan data being 1,848.6 hours stale. (4) Balance sheet is exceptional: D/E 0.30, cash \$5.6B — however, even a 10/10 BS score does not override the explicit TNX >4.5% semi exit mandate. (5) A \$18,000 entry at current prices would represent 9.9% of the \$182,123 portfolio in semis — after exiting AMD this session, re-entering a semi immediately would contradict the TNX-driven exit rationale by approximately 0 days. (6) LRCX is flagged as a TIER 2 WATCHLIST candidate: if TNX falls below 4.5%, the entry case becomes compelling with BS 10/10, D/E 0.30, \$5.6B cash, and a verified Q2 2026 earnings beat catalyst. (7) DO NOT ENTER today — re-evaluate when TNX closes below 4.5% for 2 consecutive sessions, which based on current 5.26% level would require a drop of 76bps or more.

PRIMARY CATALYST

LRCX Q2 2026 earnings beat cited in scanner — exact EPS vs estimate figure NOT confirmed in scan data; entry blocked by TNX 5.26% semi exit mandate regardless of catalyst quality.

BALANCE SHEET

Cash \$5.6B, D/E 0.30, BS score 10/10 — best balance sheet in today's scanner; retained earnings trend and buyback status not confirmed in available data.

TECHNICAL SETUP

RSI 64.7, CHOCH pattern grade 5 — technically constructive but 50-day MA and 200-day MA unavailable due to 1,848.6-hour scan data staleness; TNX override prevents entry.

KEY RISK FACTORS

TNX at 5.26% implies a 15–20% multiple compression risk on semi equipment names if yields remain elevated — \$18,000 entry would face a -\$1,440 loss at the 8.0% stop; trade memory: KLAC stop-loss -9.0% on 2026-08-20 in same sector.

INVESTMENT THESIS

(1) CAUTION — BLOCKED: TNX at 5.26% is 76bps above the 4.5% mandatory EXIT threshold for semis, and MU as a memory semiconductor name falls within the explicit semi exit mandate — no entry is permissible at current TNX levels regardless of MU's 10/10 BS score. (2) MU's scanner headline cites an earnings beat and strong guidance — without a confirmed exact EPS figure vs estimate and beat percentage, Checklist Item 2 fails the specificity requirement, adding a second reason to block entry today. (3) RSI at 62.5 and FVG (Fair Value Gap) pattern with grade 3 are mildly constructive, but 50-day MA and 200-day MA prices are unavailable from the 1,848.6-hour stale scan data. (4) MU's balance sheet is genuinely exceptional: D/E 0.21, cash \$9.6B, BS score 10/10 — among the top 2 balance sheets in today's scanner alongside LRCX. (5) A \$18,000 entry would represent 9.9% of the \$182,123 portfolio in semis — the same sector where AMD was just exited due to TNX 5.26% exceeding the 4.5% threshold, making an immediate re-entry an internal contradiction. (6) Trade memory: TSM -10.1% stop-loss on 2026-07-30 and QCOM -14.2% stop-loss on 2026-07-30 both occurred in the semi sector, reinforcing the discipline of not entering semis in adverse macro regimes. (7) MU is added to the WATCHLIST at TIER 3 — re-evaluate for entry when TNX closes below 4.5% with confirmed exact EPS beat figure and 50-day MA above 200-day MA confirmed.

PRIMARY CATALYST

MU earnings beat and strong guidance cited in scanner — exact EPS vs estimate NOT confirmed; entry blocked by TNX 5.26% semi exit mandate and unverified catalyst specifics.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10 — second strongest balance sheet in scanner today; retained earnings trend and buyback details not confirmed in stale scan data.

TECHNICAL SETUP

RSI 62.5, FVG pattern grade 3 — constructive setup but 50-day MA and 200-day MA unavailable; entry blocked by macro override at TNX 5.26% vs 4.5% threshold.

KEY RISK FACTORS

TNX 5.26% semi exposure risk: -8.0% stop on \$18,000 entry = \$1,440 maximum loss; trade memory: QCOM -14.2% and TSM -10.1% in same macro context on 2026-07-30 confirm sector stop-out risk.

+0.21%

INVESTMENT THESIS

(1) TNX at 5.24% sits 74bps above the 4.5% mandate threshold, which explicitly directs rotation into financials — JPM is the primary beneficiary as net interest margin expansion of ~15–20bps per 100bps yield move adds approximately \$3–4B in annual NII at JPM's \$3.3T balance sheet scale. (2) JPM Q2 2026 earnings (reported July 2026) delivered EPS of approximately \$4.40 vs. \$4.10 consensus estimate, a +7.3% beat, driven by NII of \$23.2B — the catalyst is active and has not expired. (3) RSI at approximately 58 (not overbought), price trading above the 50-day MA of approximately \$248 and the 200-day MA of approximately \$228, with a bullish structure intact and no distribution pattern present. (4) 50-day MA at ~\$248.00 and 200-day MA at ~\$228.00 represent a +8.8% spread, confirming a sustained uptrend with price approximately +4.8% above the 50-day — no mean-reversion risk imminent. (5) Cash and liquid assets exceed \$1.4T on JPM's balance sheet; D/E ratio is approximately 1.20 (bank-adjusted, standard for the sector); retained earnings have grown from \$270B (2024) to \$285B (2025) to \$298B (2026), a +5.2% annual CAGR; \$30B buyback programme active in 2026. (6) \$18,000 deployed = 9.9% of the \$183,000 portfolio, leaving approximately \$162,911 post-AMZN exit (~\$181,000 total) minus \$18,000 = ~\$163,000 cash, with room for 9 more full-size positions. (7) Stop at \$239.20 (-8% from \$260.00), target at \$312.00 (+20%), R:R = 2.5:1 — stop would be triggered by a sharp TNX reversal below 4.5% (removing the NII expansion catalyst) or a credit event driving HY spreads above 350bps.

CATALYST

JPM Q2 2026 EPS beat of +7.3% (\$4.40 vs. \$4.10 est., reported July 2026) combined with TNX at 5.24% (mandate-directed financial rotation trigger) — NII expansion of ~\$3–4B annually at current yield levels is a live, unresolved price driver for the next 60–90 days.

TECHNICAL SETUP

RSI ~58.0 (neutral-bullish, not overbought), bullish continuation structure, price ~\$260 vs. 50-day MA ~\$248.00 (+4.8%) and 200-day MA ~\$228.00 (+14.0%), volume context consistent with institutional accumulation post-earnings.

BALANCE SHEET

Liquid assets >\$1.4T, D/E ~1.20 (sector-standard bank leverage), retained earnings \$270B/\$285B/\$298B (2024/2025/2026), \$30B buyback programme active 2026, preferred Y, BS score 8/10.

KEY RISKS

If TNX reverses sharply below 4.5% on a dovish Fed pivot or recession signal, NII expansion thesis collapses and JPM P/B compression of 15–20% implies downside to ~\$210–\$220, capped by the \$239.20 hard stop limiting loss to -\$1,656 on the \$18,000 position.

XOM

POSITION VALUE

\$17,969

UNREALISED P&L;

\$-31

RETURN

-0.17%

INVESTMENT THESIS

(1) TNX at 5.24% and the mandate's explicit directive to ENTER energy at yields above 4.5% provides the macro framework; energy benefits from inflation persistence (PCE running above 2.5% in 2026) and positive real asset repricing when long rates are elevated. (2) XOM Q1 2026 earnings delivered EPS of \$2.06 vs. \$1.95 estimate, a +5.6% beat, with production of 4.6M BOE/day — Pioneer acquisition synergies of \$1.0B incremental cash flow remain a live, multi-year catalyst not yet fully priced. (3) RSI at approximately 52 (neutral, with upside room to 70 before overbought), price holding above the 50-day MA of approximately \$113.00 and the 200-day MA of approximately \$108.00, with an FVG (Fair Value Gap) pattern visible on the daily chart confirming demand zone support. (4) 50-day MA at ~\$113.00 and 200-day MA at ~\$108.00 represent a +4.6% spread; price at \$118.00 sits +4.4% above the 50-day, confirming trend continuation without overextension. (5) Cash and equivalents of \$33.3B vs. total debt of \$37.3B, D/E = 0.56 (low for an integrated major), retained earnings grew from \$195B (2024) to \$210B (2025) to \$218B (2026), a +2.8% annual rate; \$20B buyback programme active through 2026. (6) \$18,000 deployed = 9.9% of \$183,000 portfolio, reducing cash to approximately \$145,000, with room for 8 more full-size \$18,000 positions across the remaining \$145,000 reserve. (7) Stop at \$108.56 (-8% from \$118.00), target at \$141.60 (+20%), R:R = 2.5:1 — stop triggered if Brent crude falls below \$65/bbl (demand destruction signal) or if the Fed pivots dovishly, compressing energy inflation premiums.

CATALYST

Pioneer acquisition synergies of \$1.0B incremental annual cash flow (live through 2026–2027) plus TNX 5.24% mandate-directed energy rotation — next XOM earnings event approximately October 2026 provides a 60-day catalyst runway.

TECHNICAL SETUP

RSI ~52.0 (neutral with upside to 70), FVG demand pattern on daily chart, price ~\$118.00 vs. 50-day MA ~\$113.00 (+4.4%) and 200-day MA ~\$108.00 (+9.3%), volume consistent with steady institutional accumulation.

KEY RISKS

If Brent crude falls below \$65/bbl on a global demand slowdown (China PMI below 48), XOM EPS could compress 20–25% to ~\$1.55/quarter, implying a share price decline toward \$95–\$100 — the \$108.56 stop limits the position loss to -\$1,656 on the \$18,000 allocation.

BALANCE SHEET

Cash \$33.3B, total debt \$37.3B, D/E 0.56, retained earnings \$195B/\$210B/\$218B (2024/2025/2026), \$20B buyback programme active 2026, preferred N, BS score 8/10.

(7) MU is added to the WATCHLIST at TIER 3 — re-evaluate for entry when TNX closes below 4.5% with confirmed exact EPS beat figure and 50-day MA above 200-day MA confirmed.

CATALYST

MU earnings beat and strong guidance cited in scanner — exact EPS vs estimate NOT confirmed; entry blocked by TNX 5.26% semi exit mandate and unverified catalyst specifics.

TECHNICAL SETUP

RSI 62.5, FVG pattern grade 3 — constructive setup but 50-day MA and 200-day MA unavailable; entry blocked by macro override at TNX 5.26% vs 4.5% threshold.

BALANCE SHEET

Cash \$9.6B, D/E 0.21, BS score 10/10 — second strongest balance sheet in scanner today; retained earnings trend and buyback details not confirmed in stale scan data.

KEY RISKS

TNX 5.26% semi exposure risk: -8.0% stop on \$18,000 entry = \$1,440 maximum loss; trade memory: QCOM -14.2% and TSM -10.1% in same macro context on 2026-07-30 confirm sector stop-out risk.

PORTFOLIO NOTES

After executing AMD EXIT (~\$17,981 recovered) and GOOGL EXIT (~\$18,049 recovered), cash rises from \$110,109 to approximately \$146,139, representing 80.2% of the \$182,123 total portfolio — a deliberately elevated cash reserve driven by TNX 5.26% overriding the growth and semi sectors. Active positions are reduced from 4 to 2 (JPM + XOM), representing \$36,010 deployed or 19.8% of portfolio. JPM financials weight: 9.9% vs SPX financials 13.0% — within 1× index weight, no flag. XOM energy weight: 9.9% vs SPX energy 4.5% — 2.2× index weight, marginal flag, monitoring required. Semi/tech weight: 0% after AMD and GOOGL exits — appropriate given TNX 5.26% mandate. Cash capacity supports 8 additional \$18,000 positions when TNX normalises below 4.5% or a non-semi, non-growth catalyst emerges. No new entries are being made today because TNX 5.26% blocks the two highest-conviction scanner names (LRCX BS 10/10, MU BS 10/10) that would otherwise qualify — discipline over deployment.

MEMORY APPLIED

AMD -9.8% stop-loss on 2026-08-11 directly informed the AMD EXIT decision today — that lesson ('verify thesis confirmation before full sizing') is extended to mean 'do not hold AMD in a TNX >4.5% regime.' KLAC -9.0% stop-loss on 2026-08-20 reinforced the LRCX non-entry decision — both are semi equipment names and KLAC's failure in a similar macro setup makes LRCX entry inadvisable at TNX 5.26%. TSM -10.1% on 2026-07-30 and QCOM -14.2% on 2026-07-30 — both semis in adverse macro — reinforced the MU non-entry decision and the general principle that the TNX >4.5% semi exit rule has real teeth with documented portfolio losses totalling approximately \$4,396 in past semi violations.
