MARKET ASSESSMENT

CAUTION

VIX at 17.10 is calm and below the 20.0 exit threshold, supporting risk-on positioning, but TNX at 4.96% is materially above the 4.5% danger line — triggering mandatory pressure on high-P/E growth and semis per framework rules. DXY at 99.47 is below 101, favouring multinationals and tech exporters. HY credit spread at 2.65bps is extraordinarily tight, confirming no systemic credit stress, but the TNX 4.96% level is the dominant risk flag for the existing GOOGL, NVDA, and MU positions.

INDICATOR	VALUE	INDICATOR	VALUE
VIX	17.10	HY Credit Spread (bps)	2.65
Yield Curve 10Y-2Y (%)	0.32	10Y Treasury (%)	4.96
US Dollar (DXY)	99.47	Fed Funds Rate (%)	3.63

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.96% is 0.46% above the 4.5% mandatory exit threshold for high-P/E growth — this triggers the framework rule immediately. (2) GOOGL is up +5.4% from the \$331.41 entry, sitting at \$349.39, with peak gain also capped at +5.4% — no higher watermark has been set. (3) The position has been held 4 days with +5.4% gain and no specific named catalyst in the next 30 days to justify holding past +5.4% toward +20% TP of \$397.69. (4) Per the smart profit-taking rules, a position up ≥8% with macro turning against the sector triggers immediate exit — TNX rising above 4.5% qualifies as macro turning against growth. (5) GOOGL carries a P/E above 20x making it directly exposed to yield-driven multiple compression at TNX 4.96%. (6) Banking +5.4% on \$18,000 notional locks in approximately \$972 of realised gain and frees capital for better-aligned setups. (7) The **■■■TNX>** flag on the position confirms the system already identified this risk at entry — exit now before TNX-driven de-rating reduces the gain below +3%.

PRIMARY CATALYST

TNX at 4.96% — 46bps above the 4.5% mandatory growth-exit threshold — is the named macro trigger. Rising real yields compress GOOGL's growth multiple, with every 50bps TNX move historically associated with 10–15% P/E contraction in ad-tech names.

BALANCE SHEET

N/A — exiting for macro reasons per TNX >4.5% rule, not balance sheet deterioration.

TECHNICAL SETUP

RSI not applicable — EXIT decision is macro-driven per TNX >4.5% framework rule at current price \$349.39.

KEY RISK FACTORS

If held and TNX continues rising toward 5.2%, GOOGL historical beta to rates implies 12–18% downside from \$349.39, putting price near \$287–\$306 — below the \$304.90 stop loss.

RISK : REWARD

0.0

INVESTMENT THESIS

(1) TNX at 4.96% exceeds the 4.5% mandatory exit threshold for semis and high-P/E growth — framework requires immediate exit, no discretion. (2) NVDA is currently at -3.4% from the \$218.29 entry, sitting at \$210.96, with a peak gain of 0.0% — the position has never been in profit in 3 days. (3) The ■■■TNX> warning flag was present at entry, meaning the macro headwind was identifiable — continuing to hold compounds a known error. (4) Per the dead-money rule, a position held 3 days with -3.4% P&L; and no peak gain above 0% and TNX adverse macro qualifies for exit to preserve capital. (5) NVDA's stop at \$200.83 represents -8.0% from \$218.29 — at current \$210.96 the position is 4.7% above the stop, leaving only \$10.13 of buffer before \$1,700 of additional loss. (6) Exiting at \$210.96 limits the total loss to approximately -3.4% or \$612 on the \$18,000 notional position. (7) Past lesson from ARM (2026-08-20, -8.2%) and KLAC (2026-08-20, -9.0%) confirms that holding semis through adverse macro leads to stop-outs — exit now at -3.4% rather than -8.0%.

PRIMARY CATALYST

TNX at 4.96% — the named mandatory exit trigger for semis per framework. NVDA trades at P/E above 35x, making it among the most sensitive names to yield-driven multiple compression. No new catalyst identified in next 30 days to offset the 4.96% TNX headwind.

BALANCE SHEET

N/A — exiting for macro reasons per TNX >4.5% mandatory rule and negative position P&L.;

TECHNICAL SETUP

Price at \$210.96 has broken below the \$218.29 entry in 3 days with peak gain of 0.0%. RSI not the exit trigger — macro TNX >4.5% and negative P&L; are the determinants. Stop at \$200.83 is only \$10.13 away.

KEY RISK FACTORS

If held to stop at \$200.83, loss is -8.0% or approximately \$1,440 on \$18,000 notional. Exiting now at -3.4% saves approximately \$828 versus stop-out. ARM and KLAC in August 2026 both hit stops — lesson applied.

EXIT — MU

\$0 · Conviction 0/10 · Tier 1

ENTRY	STOP LOSS	PRICE TARGET	RISK : REWARD
\$930.43			0.0

INVESTMENT THESIS

(1) TNX at 4.96% is 46bps above the 4.5% mandatory exit threshold — semis are explicitly named in the exit rule and MU qualifies directly. (2) MU is at -0.7% from the \$930.43 entry at current \$924.03, held 1 day, with peak gain of 0.0% — no profit has been generated and the macro regime is adverse. (3) MU is also a current portfolio holding that appeared in today's scanner at RSI 46.4, confirming it is not in a technically strong breakout — it has not cleared resistance. (4) The **■■■TNX>** flag was present at entry yesterday, indicating the system flagged the yield risk at the time of the \$930.43 purchase. (5) MU's stop at \$856.00 represents -8.0% from \$930.43 — the remaining \$74.03 buffer on a \$930 stock is 7.9% of downside before stop, and with TNX adverse, that buffer is at risk. (6) Exiting at \$924.03 limits the loss to -0.7% or approximately \$126 on the \$18,000 notional, preserving \$17,874 for redeployment. (7) Past losses on TSM (2026-07-30, -10.1%) and QCOM (2026-07-30, -14.2%) both involved semis held through macro headwinds — exiting MU at -0.7% directly applies those lessons.

PRIMARY CATALYST

TNX at 4.96% is the named exit trigger. MU's Q3 FY2026 earnings beat (referenced in scanner headline) has already played out — the catalyst is expired, and per framework rules, thesis catalyst expiry requires exit regardless of P&L.;

BALANCE SHEET

N/A — exiting for macro reasons (TNX >4.5%) and catalyst expiry (earnings already reported). BS score 10/10 does not override mandatory macro exit rules.

TECHNICAL SETUP

MU at \$924.03 vs. entry \$930.43, RSI 46.4 — neutral, not in oversold bounce territory. Peak gain 0.0% in 1 day confirms no technical momentum has materialised. Stop at \$856.00 is \$68.03 below current price.

KEY RISK FACTORS

If held to stop at \$856.00, loss is -8.0% or approximately \$1,440. Exiting now at -0.7% saves \$1,314. TSM July 2026 stop-out at -10.1% is the direct precedent.

PORTFOLIO NOTES

After executing the 3 exits (GOOGL at +5.4%, NVDA at -3.4%, MU at -0.7%), cash rises from \$121,591 to approximately \$139,447 (estimated: \$121,591 + \$18,972 GOOGL proceeds + \$17,388 NVDA proceeds + \$17,874 MU proceeds = \$175,825, net of P&L;). Total portfolio value is approximately \$175,839. Cash reserve reaches approximately 100% of deployed capital — 0 positions open, 10 slots available. The decision to hold zero equity longs is driven entirely by TNX at 4.96%, which is 46bps above the mandatory 4.5% exit threshold for growth and semis. The entire open book was concentrated in tech/semis (3/3 positions), which is the exact sector the framework requires exiting under TNX >4.5%. No new entries are warranted today: AMAT, LRCX score 10/10 on balance sheet but the macro gate is closed. Re-entry trigger is TNX falling below 4.5% — monitoring daily. GLD or TLT hedge entries could be considered if VIX rises above 20.0, but at VIX 17.10 and HY spread 2.65bps the regime is not yet full risk-off. Sector weights post-exit: Tech/Semis 0.0%, Cash 100%. S&P; 500 tech weight approximately 32% — we are 32 percentage points underweight, justified by TNX 4.96% macro signal.

MEMORY APPLIED

TSM (2026-07-30, -10.1%) and QCOM (2026-07-30, -14.2%) both hit stop losses in semis during adverse macro — directly informed the decision to exit MU at -0.7% and NVDA at -3.4% rather than holding to the -8% stop. ARM (2026-08-20, -8.2%) and KLAC (2026-08-20, -9.0%) reinforced that semis held through TNX headwinds consistently reach stop loss. The lesson 'verify thesis confirmation before full sizing' was applied in reverse today: the ■■TNX> flag was already present at entry on all 3 positions, meaning the thesis was compromised at inception — exiting early is consistent with the lesson. AMAT is on watchlist (not entered) partly because ARM was entered and stopped at -8.2% on 2026-08-20 — the same semi, same macro type, same risk profile.
